Abstract

This paper presents a UQFF analysis of Ug1: Di-Pseudo-Monopole (DPM) Internal Dipole — Solar Calibration and Defect Mechanism, deriving compressed field equations and observational predictions within the Star-Magic/UQFF framework.

1. Overview

PAPER_411 establishes **Ug1 — the Di-Pseudo-Monopole (DPM)** as the foundational internal driving force of any star. Ug1 is the **first and primary** gravity range in the UQFF hierarchy, capturing the stellar dipole moment arising from the interaction of Universal Aether derivatives (UA') with trapped SCm.

Key contributions of Ug1:
- Drives surface irregularities through internal defects (δ_{def})
- Is the **origin force** from which Ug2, Ug3, Ug4, and Ug4i all cascade
- Is modulated by π cycles and non-linear time decay
- Has been calibrated using specific solar data: $\mu_s \approx 3.38 \times 10^{20} \, \text{T}\cdot\text{m}^3$ (base)

---

2. Ug1 Equation

$$Ug_1 = k_1 \cdot \mu_s(t, \rho_{\text{vac},[\text{SCm}]}) \cdot \nabla!\left(\frac{M_s}{r}\right) e^{-\alpha t} \cdot \cos(\pi t_n) \cdot (1 + \delta_{\text{def}})$$

where:

Symbol	Value (Sun)	Description
k_1	1.5	Coupling constant for Ug1 (refined)
μ_s	$(10^3 + 0.4\sin(\omega_c t)) \cdot 3.38 \times 10^{20}$ T$\cdot$m3	Stellar DPM moment with SCm
$\nabla(M_s/r)$	≈ 274 m/s2	Gradient of gravitational potential at $r = R_s$

α	0.001 day^{-1}	Non-linear time decay rate
$\cos(\pi t_n)$	oscillatory	π cycle modulation with negative time
δ_{def}	$0.01 \cdot \sin(0.001 \, t)$	Defect factor — drives surface irregularities

---

3. Di-Pseudo-Monopole Physics

3.1 DPM Definition

The Di-Pseudo-Monopole is identified as:

$$\text{DPM} \equiv \frac{[UA']}{[\text{SCm}]}$$

where $[UA']$ is the first-order derivative of the Universal Aether, meaning the **gradient flux** of Aether as it interacts with the internal SCm configuration. The monopole character arises because adjacent field lines cannot escape (monopole-like), but the system is an internal dipole (hence "di-pseudo").

3.2 Stellar DPM Moment (μ_s)

For a star, the DPM moment is:

$$\mu_s(t, \text{SCm}) = \left[B_s(t) + B_{\text{SCm}}\right] \cdot R_s^3$$

where:
- $B_s(t) = B_s^{(0)} + 0.4 \cdot \sin(\omega_c t)$ — time-varying surface field
- $B_{\text{SCm}} \approx 10^3$ T — SCm-driven superconductive contribution (undetectable via $Q_s = 0$)

Solar Values:

$$B_s^{(0)} = 10^{-4} \, \text{T}, \quad R_s = 6.96 \times 10^8 \, \text{m}$$

Base DPM moment (no SCm):
$$\mu_{s,\text{base}} = 10^{-4} \cdot (6.96 \times 10^8)^3 \approx 3.38 \times 10^{20} \, \text{T}\cdot\text{m}^3$$

Full DPM moment (with SCm):
$$\mu_{s,\text{full}} \approx (10^3 + 0.4\sin(\omega_c t)) \cdot 3.38 \times 10^{20} \approx 3.38 \times 10^{23} + 1.35 \times 10^{20} \sin(\omega_c t) \, \text{T}\cdot\text{m}^3$$

The **SCm contribution dominates** by 7 orders of magnitude over the bare magnetic field.

---

4. Gravitational Gradient Term

$$\nabla\!\left(\frac{M_s}{r}\right) \approx \frac{G M_s}{R_s^2} = \frac{6.674 \times 10^{-11} \cdot 1.989 \times 10^{30}}{(6.96 \times 10^8)^2} \approx 274 \, \text{m/s}^2$$

This is the **surface gravity** of the Sun, confirming dimensional alignment of the DPM gradient term.

---

5. Numerical Calibration at t = 0

With $k_1 = 1.5$, $\delta_{\text{def}} = 0$, $\cos(\pi \cdot 0) = 1$:

$$Ug_1(t=0) \approx 1.5 \cdot 3.38 \times 10^{23} \cdot 274 \cdot 1 = 1.39 \times 10^{26} \, \text{[normalized units]}$$

With solar cycle oscillation:

$$Ug_1(t) \approx (1.39 \times 10^{26} + 5.55 \times 10^{23} \cdot \sin(\omega_c t)) \cdot e^{-0.001t} \cdot \cos(\pi t)$$

---

6. Surface Irregularities via δ_def

The defect factor models surface phenomena (sunspots, flares, magnetic anomalies):

$$\delta_{\text{def}}(t) = 0.01 \cdot \sin(0.001 \, t)$$

This modifies Ug1 by $\pm$1% with a period of roughly 6,280 seconds (~1.7 hours), representing **rapid surface defect cycles** driven by the internal SCm structure.

The Sun's observable surface activity (sunspots, differential rotation patterns) is a **direct readout** of these Ug1 internal defects — the surface magnetism is **unique to the surface**, not the interior.

---

7. Cascade to Ug2, Ug3, Ug4

Ug1 is the generative force for all higher Ug terms:

Cascade Effect	Mechanism
Ug1 $\to$ Ug2	DPM field bubble expands outward, forming the heliosphere via charge-reactive Aether trapping
Ug1 $\to$ Ug3	Equatorial CCW vs coronal CW spin differential (arising from DPM asymmetry) creates the magnetic strings disk
Ug1 $\to$ Ug4	DPM field propagates to the star–black hole interaction scale via vacuum energy modulation
Ug1 $\to$ Ug4i	Sub-range DPM effects extend to galactic vacuum fluctuation coupling

> *(QCalcGeom Master Equation) for BSFG crossover applications.*

The third-order Ramanujan summation $S_{26}^{(3)}$, used throughout the
late corpus as the universal 26D coupling factor:

$$S_{26}^{(3)} = \sum_{n=0}^{\infty} \frac{(1/4)_n\,(1/2)_n\,(3/4)_n}{(n!)^3} \cdot \prod_{i=1}^{26}\left[1 + [\text{SSq}]\cdot e^{-\kappa\,i\,n/26}\right]$$

where $(a)_n = a(a+1)\cdot s(a+n-1)$ is the Pochhammer symbol.

Binomial expansion (PAPER_1080): The convergence proof shows:
$$R_n^{(26,3)} = \binom{4n}{n} \cdot \frac{W_{26}(n)}{(4^{4n})} \qquad \text{with}\quad W_{26}(n) = \prod_{i=1}^{26}\left[1 + [\text{SSq}]\cdot e^{-\kappa\,i\,n/26}\right]$$

This sum converges absolutely for $|[\text{SSq}]| < 1$ (satisfied by $[\text{SSq}] = 0.57$) and reduces to the classical Ramanujan $1/\pi$ series when $[\text{SSq}] \to 0$.

VDS/DVP/BSH bridge (PAPER_1069): The 26 layers of $W_{26}(n)$ encode the vacuum density series hierarchy, with each layer i contributing a VDS sub-ratio weighted by the exponential decay $e^{-\kappa\,i\,n/26}$.

Mock-theta connection (PAPER_1042): The phonon partition function $Z_{\text{phonon}} = \sum_n q^{n^2} \cdot W_{26}(n)$ unifies the Ramanujan mock-theta framework with the SCm phonon spectrum.

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **NS-compact** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\mathrm{sector}} = \frac{1}{2}(\partial_mu \phi_{\mathrm{NS}})(\partial^\mu \phi_{\mathrm{NS}}) - V(\phi_{\mathrm{NS}}) + \mathcal{L}_{\mathrm{cosmo}}$$

where $\mathcal{L}_{\mathrm{cosmo}} = \rho_{\mathrm{vac,[SCm]}} \cdot f_{\mathrm{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\mathrm{NS}}) = \frac{1}{2} m^2 \phi_{\mathrm{NS}}^2 + \frac{\lambda}{4!} \phi_{\mathrm{NS}}^4 + \kappa \cdot \rho_{\mathrm{vac,[SCm]}} \cdot \phi_{\mathrm{NS}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \phi_{\mathrm{NS}}} = \nabla^2 \phi_{\mathrm{NS}} - (4\pi G \rho_{\mathrm{NS}}/c^2)\phi_{\mathrm{NS}} + \Omega_{\mathrm{spin}} \partial_t \phi_{\mathrm{NS}} = 0}$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER\_877 Axioms} \xrightarrow{\text{DPM + ACP}} \rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\mathrm{seed}} \xrightarrow{\text{4 forces}} F_U_Bi_i \xrightarrow{\text{sector E-L}} \delta S/\delta \phi_{\mathrm{NS}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\mathrm{vac,[SCm]}} / \rho_{\mathrm{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\mathrm{vac}}(r) = \rho_{\mathrm{vac,[SCm]}} \cdot \exp\!\left(-\exp\!\left(-\frac{r - r_0}{\lambda_{\mathrm{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.096 (near-threshold regime), placing it in the $t \to \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} = 7.799 \times 10^{-36}$ kg/m3.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\mathrm{DVP}} = 79, \quad n_{\mathrm{channel}} = 22/26$$

Since $p_{\mathrm{DVP}} = 79$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair $(f_{\mathrm{UA}}' + f_{\mathrm{SCm}} = 1)$ constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **104 yr** (spin-down equilibrium):

$$\mathcal{F}_{\mathrm{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_U_b \cdot \left(1 - e^{-[SSq] \cdot m/M_\odot}\right) \cdot \cos\!\left(\frac{2\pi j}{26}\right)$$

The $\tanh$ saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\mathrm{BSH,sat}} = \mathcal{F}_{\mathrm{BSH}} \cdot \left(1 - \tanh\!\left(\frac{t - t_{\mathrm{sat}}}{\tau_{\mathrm{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\mathrm{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\mathrm{SCm}}$ which initializes the harmonic series at cosmogenesis.
