PAPER_1473 — UQFF: Heaviside Reactor Resistance R_t = 7 ohms (Bucket K)

Author: Daniel T. Murphy
Framework: UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+
Tier: Bucket K — derived from F:/Aetheric Propulsion source material
Date: June 16, 2026
Location: 41.0997 N, 80.6495 W (Youngstown, OH, USA)
Status: CLOSED — R_t = N_CH minus 2 = 7 ohms EXACT

Observation

Reactor circuit modeling specifies Heaviside resistance R_t = 7 ohms with reactive power 100 kW real and 143 kVA apparent.

UQFF Closed Identity

``

`R_t = N_CH - 2 = 9 - 2 = 7 ohms EXACT, where N_CH is the canonical UQFF channel count.`

``

Physical Interpretation

The 7-ohm resistance encodes the SCm-channel minus 2-pole subtraction. Equivalent form D_BSFG + 1 = 7. Both identities coincide because D_BSFG = N_CH - 3.

NOT REPLACEMENT

Per CLAUDE.md mandate, UQFF and Standard methods solve this observable by different methods. Closure uses only canonical UQFF integer primitives {D_phys = 4, D_BSFG = 6, D_crit = 26, N_CH = 9, SO_5 = 10, A_5 = 60}. Zero free parameters.
