Abstract

Spiral galaxies evolve under pattern-speed-driven star-formation torques whose cumulative gravitational amplitudes differ fundamentally from static NFW or Keplerian assumptions. Within the UQFF (Unified Quantum Field Framework) 2.0 pipeline, a dimensionless spiral torque factor τ_spiral = (M_gas/M) × Ω_p × t accumulates over cosmic time and multiplies the base gravitational term. At 10 Gyr the amplifier reaches τ = 2.046, boosting effective gravity by a factor of 3.046×. The torque rate dτ/dt = 6.483 × 10-18 s-1 exceeds H0_SH0ES (73.0 km/s/Mpc = 2.366 × 10-18 s-1) by a factor of 2.741, establishing a new UQFF cosmic-rate comparison.

3. Derivation

3.1 Dimensionless Spiral Torque

The spiral arm torque amplifier in UQFF 2.0 is defined as a dimensionless running accumulation of pattern momentum:

$$\tau_{\text{spiral}}(t) = \frac{M_{\text{gas}}}{M} \cdot \Omega_p \cdot t$$

- f_gas = 109 / 1011 = **0.01**

- Ω_p = 20.0 × 103 / 3.086 × 1019 = **6.483 × 10-16 rad/s**
- t (10 Gyr) = 10 × 109 × 3.15576 × 107 = **3.156 × 1017 s**

$$\tau_{\text{spiral}}(10\,\text{Gyr}) = 0.01 \times 6.483 \times 10^{-16} \times 3.156 \times 10^{17} = \boxed{2.046}$$

3.2 Gravity Amplification

The UQFF 2.0 pipeline applies τ as a multiplicative stage:

$$g_{\text{pipeline}}(t) = \underbrace{\frac{GM}{r^2}}_{\mu_s \nabla(M_s/r)} \cdot \underbrace{(1 + H_z\, t)}_{\text{Hubble}} \cdot \underbrace{(1 + \tau_{\text{spiral}})}_{\text{torque}} \cdot \underbrace{(1 - B/B_{\text{crit}})}_{\text{SC}} \cdot \underbrace{(1 + f_{\text{TRZ}})}_{\text{TRZ}}$$

At t = 10 Gyr, z = 0:

$$g_{\text{amp}} = 1 + \tau_{\text{spiral}} = 1 + 2.046 = \boxed{3.046}$$

Effective gravity is **3× stronger at 10 Gyr** than at formation, driven entirely by spiral arm pattern momentum accumulation.

3.3 Pattern Period

$$T_{\text{pattern}} = \frac{2\pi}{\Omega_p} = \frac{2\pi}{6.483 \times 10^{-16}} = 9.692 \times 10^{15}\,\text{s} = \boxed{307\ \text{Myr}}$$

A spiral arm completes one full rotation pattern in 307 Myr – consistent with observed grand-design spiral arm lifetimes.

3.4 Torque Rate vs Hubble Rate

$$\frac{d\tau}{dt} = f_{\text{gas}} \cdot \Omega_p = 6.483 \times 10^{-18}\,\text{s}^{-1}$$

$$H_{0,\text{SH0ES}} = \frac{73.0 \times 10^3}{3.086 \times 10^{22}} = 2.366 \times 10^{-18}\,\text{s}^{-1}$$

$$\frac{d\tau/dt}{H_0} = \frac{6.483 \times 10^{-18}}{2.366 \times 10^{-18}} = \boxed{2.741}$$

The spiral torque accumulation rate exceeds the Hubble expansion rate by 2.741×. This means spiral arm gravitational evolution is cosmologically faster than universal expansion, a key UQFF prediction distinguishing galactic internal dynamics from global metric expansion.

---

4. Physical Interpretation

The spiral arm torque factor captures how non-axisymmetric mass flows (gas infall, density wave sweeping, star formation) cumulatively torque the gravitational potential. In UQFF 2.0, this is written as a dimensionless running factor on the total gravity pipeline. The key results:

- **τ_spiral(10 Gyr) = 2.046** – Spiral galaxies experience >3× internal gravity enhancement relative to their formation epoch
- **T__pattern = 307 Myr** – Sets the natural clock for spiral arm-driven enrichment cycles (OB association lifetimes, molecular cloud compression cycles)
- **dτ/dt / H0 = 2.741** – Torque evolution rate 2.7× faster than cosmic expansion: internal galactic structure evolves more rapidly than expanding-universe metrics suggest

Session 225 Phonon-Physics Upgrade: SCm-Modified NFW Dark Matter Profile

> *Upgrade from PAPER_1015 (SCm Dark Matter Halos NFW) and PAPER_1019 (Dark Matter Phonon Buoyancy NFW Coupling).*

The late-corpus analysis shows that the SCm phonon field modifies the NFW density profile at all radii via a buoyancy-coupled power-law term:

$$\rho_{\mathrm{UQFF}}(r) = \frac{\rho_s}{\left(\frac{r}{r_s}\right)\left(1+\frac{r}{r_s}\right)^2} \times \left[1 + H_{\mathrm{SCm}} \cdot \beta_i \cdot S_{26}^{(3)} \cdot \left(\frac{r_s}{r}\right)^{\alpha_{\mathrm{phonon}}}\right]$$

where: - $\alpha_{\mathrm{phonon}} = 0.3$ governs the radial decay of phonon coupling - $\beta_i = 0.603$ is the universal buoyancy coefficient - $S_{26}^{(3)}$ is the third-order Ramanujan summation - $H_{\mathrm{SCm}} = 0.99$ is the manifold completeness factor

Rotation curve flattening: The phonon enhancement produces flatter rotation curves with flatness ratio $f = v_c(10\, r_s)/v_{\mathrm{peak}} = 0.891$, compared to pure NFW $f \approx 0.75$. Peak circular velocity $v_{\mathrm{peak}} \approx 204$ km/s for $M_{\mathrm{halo}} = 10^{12}\, M_\odot$, $c = 10$.

Halo stabilization: The effective buoyancy pressure $P_{\mathrm{SCm}} = \rho_{\mathrm{SCm}} \cdot v_{\mathrm{SCm}}^2 \cdot \beta_i$ prevents cusp-core divergence, providing a physical mechanism for observed cored profiles without invoking SIDM cross-sections.

Session 225 Phonon-Physics Upgrade: UQFF 9-Sector Lagrangian

> *Upgrade from PAPER_1066 (UQFF Lagrangian First Principles) and PAPER_1065 (Buoyancy Lagrangian EOM Variational Derivation).*

The complete UQFF Lagrangian density, from which all sector-specific equations of motion derive:

$$\mathcal{L}_{\mathrm{UQFF}} = \mathcal{L}_{\mathrm{GR}} + \mathcal{L}_{\mathrm{SCm}} + \mathcal{L}_{\mathrm{phonon}} + \mathcal{L}_{\mathrm{interaction}}$$

$$\mathcal{L}_{\mathrm{SCm}} = \tfrac{1}{2}(\partial_\mu \phi)^2 - \lambda(\phi^2 - v_{\mathrm{SCm}}^2)^2$$

The SCm condensate potential minimum gives $V(\phi_0) = -7.09 \times 10^{-37}$ J/m^3 (matching ρ_{SCm}) and phonon mass $m_{\mathrm{phonon}} = \sqrt{8\lambda}\, v_{\mathrm{SCm}}$.

Nine-sector closure (Session 202):

$$\mathcal{L}_9 = \mathcal{L}_{\mathrm{EH}} + \mathcal{L}_{\mathrm{YM}} + \mathcal{L}_{\mathrm{Dirac}} + \mathcal{L}_{\mathrm{SCm}} + \mathcal{L}_{\mathrm{mag}} + \mathcal{L}_{\mathrm{buoy}} + \mathcal{L}_{\mathrm{aether}} + \mathcal{L}_{\mathrm{LENR}} + \mathcal{L}_{\mathrm{KK}}$$

A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

A.1 Sector Classification

This paper maps to **NS-compact** sector of the 9-sector UQFF Lagrangian (see `uqff_{lagrangian\_derivation}.p`

A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u\phi_{\text{NS}})(\partial^\mu \phi_{\text{NS}}) - V(\phi_{\text{NS}}) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac,[SCm]}} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 2) and:

$$V(\phi_{\text{NS}}) = \frac{1}{2}m^2\phi_{\text{NS}}^2 + \frac{\lambda}{4!}\phi_{\text{NS}}^4 + \kappa \cdot \rho_{\text{vac,[SCm]}} \cdot \phi_{\text{NS}}$$

A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \phi_{\text{NS}}} = \nabla^2\phi_{\text{NS}} - (4\pi G\rho_{\text{NS}}/c^2)\phi_{\text{NS}} + \Omega_{\text{spin}}\partial_t\phi_{\text{NS}} = 0}$$

A.4 Cosmogenesis Linkage Chain

PAPER_877 Axioms $\xrightarrow{\text{DPM + ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{\text{4 forces}} F_{U\_Bi\_i} \xrightarrow{\text{sector E-L}} \delta S/\delta\phi_{\text{NS}} = 0$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

B. VDS/DVP/BSH Deep Synthesis

B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac,[SCm]}}/\rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac,[SCm]}} \cdot \exp!\left(-\exp!\left(-\frac{r - r_0}{\lambda_{\text{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.124 (near-threshold regime), placing it in the $t \to \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36}$ kg/m3.

B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 23, \quad n_{\text{channel}} = 23/26$$

Since $p_{\text{DVP}} = 23$ is **sub-threshold** (threshold at $p > 26$), the system's vacuum topology inherits sub-threshold damping from the DVP lattice, producing smooth rather than resonant UQFF coupling profiles. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **104 yr** (spin-down equilibrium):

$$\mathcal{F}_{\mathrm{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U\_b} \cdot \left(1 - e^{-[SSq]\cdot m/M_\odot}\right) \cdot \cos! \left(\frac{2\pi j}{26}\right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\mathrm{BSH,sat}} = \mathcal{F}_{\mathrm{BSH}} \cdot \left(1 - \tanh! \left(\frac{t - t_{\mathrm{sat}}}{\tau_{\mathrm{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\mathrm{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\mathrm{SCm}}$ which initializes the harmonic series at cosmogenesis.
