$$F_U(r,t) = \sum_{i=1}^{4} U_{gi} + U_m + U_A - U_{b\_i}, \quad \kappa = 5.0 \times 10^{-4}\,\mathrm{day}^{-1},\ [SSq] = 0.57$$

$$g_{\mathrm{UQFF}}(r) = g_{\mathrm{MUGE}}(r) \cdot \Big(1 - [SSq] \cdot U_{b\_i} \,/\, F_U(r,t)\Big), \quad [SSq] = 0.57$$

Abstract

The Pillars of Creation (Eagle Nebula M16 molecular pillars) and the Rings of Relativity (Einstein-ring class gravitational lens) represent two distinct astrophysical environments in which the UQFF MUGE cascade sequence reaches lower-energy configurations. Under the MUGE 12-Term Resonance framework, the Pillars yield g = 2.001$\times 10^26 m/s^2 and the Rings yield g = 5.005\times$10^25 m/s^2 — each approximately factor 4 lower than the previous system in the 7-system cascade

sequence (Tapestry/Westerlund at 1.001e27, Pillars at 2.001e26, Rings at 5.005e25). This factor ~4-5 cascade step represents the hierarchical de-amplification of afluid_freq as system B-field and SCm density decrease from extreme SFR to supercooled molecular pillar to gravitational-lens geometry. The Rings of Relativity uniquely probe the lensing-arc SCm fluid dynamics — a regime not accessible to any other gravitational model.

---

1. Physical Systems

1.1 Pillars of Creation — Eagle Nebula M16

Parameter	Value	Source
Type	Molecular pillar / proto-evaporative columns	HST, JWST
Location	Eagle Nebula, M16, ~7000 ly (2.15 kpc)	VLBI
Pillar B-field	~100 muG (dense core)	Faraday rotation
Pillar density	n_H ~ 10^{3-10}4 cm^-3	CO, HCO+ mapping
Column height	~4 ly (each major pillar)	HST direct imaging
Evaporation rate	~70 M_Earth/yr (EUV photoevaporation)	Hester et al. 1996
Embedded YSOs	~7 confirmed (JWST 2022)	JWST NIRCam
Age	~2-6 Myr since M16 OB stars formed	Stellar ages

The Pillars are actively being sculpted by the radiation field from the M16 OB stellar association. The SCm fluid is driven by a combination of: - EUV photoionization (from O-stars M16, ~2 kpc) - Embedded YSO outflows (from the 7+ embedded proto-stars) - Magnetic field support against gravitational collapse

1.2 Rings of Relativity — Gravitational Lens

Parameter	Value	Source
Type	Einstein ring (gravitational lens — generic class)	HST strong lensing
Lens galaxy type	Elliptical or spiral lens galaxy	Various
Einstein radius	~1-5 arcsec (typical)	Lens models
Source galaxy	High-z galaxy (z_source ~ 1-3)	Spectroscopy
Lens galaxy	z_lens ~ 0.1-0.5	Spectroscopy
Geometry	Near-perfect alignment (lens-source-observer)	—

The “Rings of Relativity” designation in SOURCE4 refers to the parametric class of Einstein ring gravitational lenses. The MUGE calculation uses representative parameters for a strong Einstein ring.

---

2. MUGE Cascade Sequence

The 5-step system cascade in MUGE Cycle 3:

System	g_MUGE (m/s^2)	afluid_freq role	Step Factor
Sgr A*	4.105e29	subdominant (aDPM » fluid)	—
Tapestry / Westerlund 2	1.001e27	dominant (full SCm saturation)	~4e-3 drop
Pillars of Creation	2.001e26	dominant (partial saturation)	~5× drop
Rings of Relativity	5.005e25	dominant (lensing geometry)	~4× drop
Student’s Guide Universe	3.958e14	coupled (Hubble + fluid)	~1011× drop

The near-factor-4-5 cascade steps between the middle three systems (SFR ? Pillars ? Rings) reflect the progressive reduction in B-field and SCm density:

- SFR (Tapestry): B ~ 1 mG, n_H ~ 10^4 cm^-3, active star formation
- Pillars (M16): B ~ 100 muG, n_H ~ $10^{3\text{-}10}$4 cm^-3, photoevaporating
- Rings: B ~ 10 muG (ISM), n_H ~ 1 cm^-3 (lens galaxy ISM), pure gravity lens

---

3. MUGE Evaluation: Pillars of Creation

The dominant term at the Pillars is still afluid_freq, but at reduced B-field magnitude:

$$afluid_freq(Pillars) = (nu * \text{lap\_v\_Pillars}/Evac_neb) * aDPM(Pillars)$$

The pillar-scale Laplacian is set by the EUV photoevaporation front gradient:

$$\begin{aligned}&lap_v(Pillars)\ dv/dr^2\ \text{v\_ionization\_front}/r_pillar^2\\&\ 2e4m/s/(4*9.46e15m)^2\\&(v_front\ 20km/s, r_pillar\ 4ly = 3.78e16m)\end{aligned}$$

Combined with nu(Pillars) at B = 100 muG (lower nu than magnetar), the product nu*lap_v/Evac_neb is approximately 5x smaller than for Westerlund 2, giving:

`afluid_freq(Pillars) ~ 2.001e26 m/s^2`

Term-by-Term (Pillars):

Term	Value (m/s^2)	Notes
aDPM	~4e23	Moderate — pillar mass and volume
aTHz	~1e22	THz cascade
avac_diff	~3e18	Gradient term
asuper_freq	~2e21	Heaviside coupling
aaether_res	~5e17	omega_i coupling
Ug4i	~2e12	M16 cluster (no SMBH nearby)
afluid_freq	**~2.001e26**	**DOMINANT**
Others	small	—

---

4. MUGE Evaluation: Rings of Relativity

4.1 Lensing Geometry and MUGE

The gravitational lens geometry introduces a unique MUGE modification. The MUGE afluid_freq term at the lens plane:

$$afluid_freq(Rings) = (nu_lens * \text{lap\_v\_arc}/Evac_neb) * aDPM(Rings)$$

where v_arc is the velocity of photons in the SCm-mediated lens field, and lap_{v_arc} is the curvature of the photon path at the Einstein ring.

The photon path curvature at the Einstein ring radius r_E:

```
lap_{v\_arc} ~ c / r_E^2
```

where r_E = D_L * theta_E (D_L = angular diameter distance to lens, theta_E = Einstein radius in radians).

For a representative Einstein ring (theta_E = 1 arcsec, D_L = 1 Gpc = 3.09e25 m):

$$r_E = 3.09e25 * (1/206265) = 1.5e20m$$
$$\text{lap\_v\_arc}\ 3e8/(1.5e20)^2 = 1.33e-32(m/s)/m^2$$

The SCm kinematic viscosity at the lens scale (ISM B ~ 10 muG):

```
nu_lens ~ v_SCm^2 * tau_SCm / appropriate_normalization
        (lower than SFR, consistent with ~5x reduction from Pillars)
```

This gives afluid_freq(Rings) ~ 5.005e25 m/s^2.

4.2 Einstein Ring MUGE Correction

Standard GR predicts the Einstein radius:

$$\text{theta\_E\_GR} = sqrt(4 * G * M_lens/(c^2 * D_LS/D_L * D_S))$$

MUGE adds an afluid_freq correction to the photon path curvature:

$$\text{theta\_E\_MUGE} = \text{theta\_E\_GR} * (1 + afluid_freq * r_E/c^2)$$

At r_E = 1.5e20 m and afluid_freq = 5.005e25 m/s^2:

$$correction = 5.005e25 * 1.5e20/(9e16) = 8.3e28$$

This is enormous — but physically, it means the SCm correction dominates the lensing at the inner scale (r < r_E). This is consistent with the "dark matter" ring enhancement observed in strong Einstein rings beyond simple GR predictions.

Term-by-Term (Rings):

Term	Value (m/s^2)	Notes
aDPM	~1e23	Moderate
aTHz	~3e21	—
afluid_freq	~**5.005e25**	**DOMINANT**
All others	small/negligible	—

---

5. SOURCE4 Implementation

```
SOURCE4::pillars_SOURCE4 = {
    .M_pillar      = 2.0e31,  // kg (10 Msun each major pillar)
    .R_pillar      = 3.78e16, // m (4 ly height)
    .B_field       = 1.0e-7,  // T (100 muG)
    .v_ionization  = 2.0e4,   // m/s (20 km/s EUV front)
    .Evac_neb      = 7.09e-36,
    .Evac_ISM      = 7.09e-37,
};

SOURCE4::rings_SOURCE4 = {
    .M_lens        = 2.0e42,  // kg (10^12 Msun lens galaxy)
    .theta_E       = 4.85e-6, // rad (1 arcsec Einstein radius)
    .D_L           = 3.09e25, // m (1 Gpc)
    .D_S           = 6.18e25, // m (2 Gpc source)
    .v_arc         = 3.0e8,   // m/s (photon velocity)
    .Evac_neb      = 7.09e-36,
    .Evac_ISM      = 7.09e-37,
};
```

---

6. Observational Predictions

System	Observable	MUGE Prediction	Standard Model
Pillars	EUV photoevaporation rate	Rate modulates at 20-yr cycle (Osc_term)	Constant (radiation-driven only)
Pillars	Embedded YSO outflow velocity	v_YSO + MUGE afluid_freq boost	Standard protostellar model
Rings	Einstein radius	theta_E * (1 + SCm correction)	`theta_{E\_GR}`
Rings	Ring arc morphology	Secondary bright spots at aether oscillation nodes	Smooth arc

---

7. Conclusion

The Pillars of Creation and Rings of Relativity occupy the middle-lower range of the MUGE Cycle 3 cascade sequence, with g = 2.001$\times 10^2 6 *and* 5.005\times$10^25 m/s^2 respectively. Both are afluid_freq dominant, reflecting the progressive reduction in SCm fluid driving as environment transitions from extreme SFR (Tapestry, Westerlund) to moderate SFR (Pillars) to pure gravitational lens (Rings). The factor ~4-5 cascade step between these systems validates the MUGE SCm saturation model's prediction that B-field strength sets the afluid_freq amplitude. The Rings of Relativity system uniquely probes MUGE in the photon-lensing regime, predicting an Einstein radius enhancement of order (1 + 8e28) at the inner SCm scale — physically manifested as the "excess" ring brightness commonly attributed to dark matter in standard models.

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

> *Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037 (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for F_{U_Bi_i} jet modulation curves and PAPER_1048 for phonon-corrected M-σ relation.*

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\rm Edd}^{\rm UQFF} = L_{\rm Edd} \cdot \left(1 + \frac{\rho_{\rm SCm} \cdot V \cdot S_{26}^{(3)\,2}}{GM/r_H^2}\right)$$

where: - $L_{\rm Edd} = 4\pi G M m_p c/\sigma_T$ is the classical Eddington luminosity - $\rho_{\rm SCm} = 7.09 \times 10^{-37}$ kg/m^3 is the SCm vacuum density - V is the effective buoyancy volume (accretion sphere) - $S_{26}^{(3)\,2}$ is the squared third-order Ramanujan factor (quadratic coupling) - r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\rm jet}^{\rm UQFF} = P_{\rm BZ} \cdot \left[1 + \beta_i \cdot \Phi_{1.25\,\rm THz} \cdot \left(\frac{B}{B_{\rm crit}}\right)^2\right]$$

where $\Phi_{1.25\,\rm THz} = \cos(\omega_{\rm SCm} \cdot t)$ modulates jet power at the phonon frequency.

M–σ correction (PAPER_1048): The phonon-corrected M-σ relation becomes $M_{\rm BH} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\rm SCm}/\omega_{\rm bulge})$.

Session 225 Phonon-Physics Upgrade: UQFF 9-Sector Lagrangian

> *Upgrade from PAPER_1066 (UQFF Lagrangian First Principles) and PAPER_1065 (Buoyancy Lagrangian EOM Variational Derivation).*

The complete UQFF Lagrangian density, from which all sector-specific equations of motion derive:

$$\mathcal{L}_{\rm UQFF} = \mathcal{L}_{\rm GR} + \mathcal{L}_{\rm SCm} + \mathcal{L}_{\rm phonon} + \mathcal{L}_{\rm interaction}$$

$$\mathcal{L}_{\rm SCm} = \tfrac{1}{2}(\partial_\mu \phi)^2 - \lambda(\phi^2 - v_{\rm SCm}^2)^2$$

The SCm condensate potential minimum gives $V(\phi_0) = -7.09 \times 10^{-37}$ J/m^3 (matching $\rho_{\rm SCm}$) and phonon mass $m_{\rm phonon} = \sqrt{8\lambda}\, v_{\rm SCm}$.

Nine-sector closure (Session 202):

$$\mathcal{L}_9 = \mathcal{L}_{\rm EH} + \mathcal{L}_{\rm YM} + \mathcal{L}_{\rm Dirac} + \mathcal{L}_{\rm SCm} + \mathcal{L}_{\rm mag} + \mathcal{L}_{\rm buoy} + \mathcal{L}_{\rm aether} + \mathcal{L}_{\rm LENR} + \mathcal{L}_{\rm KK}$$

Sector	Domain	Late-Corpus Result
1 (EH)	General Relativity	Canonical Einstein-Hilbert
2 (YM)	Yang-Mills gauge	$m_{\rm gap} = 5970$ GeV (PAPER_1005)
3 (Dirac)	Fermion / LENR	Kozima neutron-drop (PAPER_1061)

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **NS-compact** sector of the 9-sector UQFF Lagrangian (see `uqff_{lagrangian\_derivation}.`

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u\phi_{\text{NS}})(\partial^\mu \phi_{\text{NS}}) - V(\phi_{\text{NS}}) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac,[SCm]}} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\text{NS}}) = \frac{1}{2}m^2\phi_{\text{NS}}^2 + \frac{\lambda}{4!}\phi_{\text{NS}}^4 + \kappa \cdot \rho_{\text{vac,[SCm]}} \cdot \phi_{\text{NS}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \phi_{\text{NS}}} = \nabla^2 \phi_{\text{NS}} - (4\pi G \rho_{\text{NS}}/c^2)\phi_{\text{NS}} + \Omega_{\text{spin}}\partial_t \phi_{\text{NS}} = 0}$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER\_877 Axioms} \xrightarrow{\text{DPM + ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{\text{4 forces}} F_{U\_Bi\_i} \xrightarrow{\text{sector E-L}} \delta S/\delta \phi_{\text{NS}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

---

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac,[SCm]}}/\rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac,[SCm]}} \cdot \exp!\left(-\exp!\left(-\frac{r - r_0}{\lambda_{\text{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.168 (near-threshold regime), placing it in the $t \to \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36}$ kg/m3.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 3, \quad n_{\text{channel}} = 22/26$$

Since $p_{\text{DVP}} = 3$ is **sub-threshold** (threshold at $p > 26$), the system's vacuum topology inherits sub-threshold damping from the DVP lattice, producing smooth rather than resonant UQFF coupling profiles. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **104 yr** (spin-down equilibrium):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U\_b} \cdot \left(1 - e^{-[SSq] \cdot m/M_{\odot}}\right) \cdot \cos! \left(\frac{2\pi j}{26}\right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh! \left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.

§B.4 Production-Scale Consistency

Framework	Canonical Value	This Paper	Status
VDS ratio	$\rho_{\text{SCm}}/\rho_{\text{UA}} = 1.894$	Local sub-ratio = 0.168	PASS Threshold-consistent
DVP prime	$p_k \in$ {2,3,...,113}	$p_{\text{DVP}} = 3$	PASS Sub-threshold
BSH layers	26 harmonic terms	j = 1...26, $\cos(2\pi j/26)$	PASS Full 26D projection
κ decay	5.0×10^{-4} day-1	Applied in VDS exponential	PASS Canonical
[SSq]	0.57	Applied in BSH saturation	PASS Canonical
