Abstract

This paper presents a UQFF analysis of Ug2: Heliosphere Bubble Charge-Coupled E_react Form, deriving compressed field equations and observational predictions within the Star-Magic/UQFF framework.

1. Overview

PAPER_393 established the E_react decay law:

$$E_{\text{react}} = \frac{\rho_{\text{SCm}} \cdot v_{\text{SCm}}^2}{\rho_A} \cdot \exp(-\kappa \cdot t)$$

PAPER_400 extracts the **complete Ug2 formula** as implemented in the Star Magic construction file C++ source, revealing three new coupling components not present in earlier formulations:

1. **Dual charge sum** $(Q_A + Q_{UA})$ replacing single-charge Q

2. **Heaviside step** $S(r - R_b)$ enforcing heliosphere bubble boundary cutoff

3. **Solar wind velocity modulation** $(1 + \delta_{sw} \cdot v_{sw})$

4. **E_react multiplicative closure**

This is the **FIRST Ug2 formulation with (QA+QUA) charge coupling + Heaviside S(r-Rb) + E_react multiplicative**.

---

2. Formula

2.1 Ug2 Complete Expression

$$\boxed{U_{g2} = k_2 \cdot (Q_A + Q_{UA}) \cdot \frac{M}{r^2} \cdot S(r - R_b) \cdot (1 + \delta_{sw} \cdot v_{sw}) \cdot H_{\text{SCm}} \cdot E_{\text{react}}}$$

where: - $S(r - R_b)$ is the Heaviside step function: $S(x) = 1$ if $x \geq 0$, $S(x) = 0$ if $x < 0$ - R_b = heliosphere bubble radius - v_{sw} = solar wind velocity (m/s) - δ_{sw} = solar wind modulation coefficient

2.2 E_react Coupling (from PAPER_393)

$$E_{\text{react}} = \frac{\rho_{\text{SCm}} \cdot v_{\text{SCm}}^2}{\rho_A} \cdot \exp(-\kappa \cdot t)$$

---

3. Parameters

Symbol	Value	Source
k_2	1.2	Construction file C++ constant
Q_A	1×10^{-10} C	Aether charge coupling
Q_{UA}	1×10^{-10} C	UA charge coupling (same order)
δ_{sw}	0.01	Solar wind coefficient
v_{sw}	5×10^5 m/s	Solar wind speed (500 km/s canonical)
H_{SCm}	1.0	SCm suppression factor (default)
κ	5×10^{-4} day^{-1}	E_react decay rate (PAPER_393)
ρ_A	1×10^{-23} kg/m3	Aether density
v_{SCm}	2.968×10^8 m/s (0.99c)	SCm velocity (PAPER_387)

---

4. Novel Physics

4.1 Dual Charge (QA + QUA)

The sum $(Q_A + Q_{UA})$ represents simultaneous Aether and Unified Aether charge contributions. At equal charge levels ($Q_A = Q_{UA} = 10^{-10}$ C), the effective charge doubles:

$$Q_{\text{eff}} = Q_A + Q_{UA} = 2 \times 10^{-10} \text{ C}$$

This doubles U_{g2} compared to any single-charge model.

4.2 Heliosphere Bubble Boundary (Heaviside Cutoff)

$S(r - R_b)$ enforces that Ug2 is **zero inside the heliosphere bubble** and active only in the region $r \geq R_b$. This is physically motivated: the heliospheric magnetic field terminates SCm-mediated charge coupling at the heliopause boundary.

For the solar system: $R_b \approx 1.2 \times 10^{14}$ m (~800 AU heliopause radius).

4.3 Solar Wind Velocity Modulation

The factor $(1 + \delta_{sw} \cdot v_{sw})$:

$$1 + \delta_{sw} \cdot v_{sw} = 1 + (0.01)(5 \times 10^5) = 1 + 5000 = 5001$$

This creates a **5001× amplification** of U_{g2} due to solar wind dynamic coupling. The solar wind traveling at 0.99c in the SCm medium generates enhanced charge reactivity.

4.4 Combined Numerical Example (Sun, $r = 1.5 \times 10^{11}$ m)

$$U_{g2} = 1.2 \times (2 \times 10^{-10}) \times \frac{1.989 \times 10^{30}}{(1.5 \times 10^{11})^2} \times 1 \times 5001 \times 1.0 \times E_{\text{react}}(t = 0)$$

$$E_{\text{react}}(t = 0) = \frac{(10^{15})(2.968 \times 10^8)^2}{10^{-23}} = 8.808 \times 10^{54} \text{ J/m}^3$$

$$U_{g2} \approx 1.2 \times 2 \times 10^{-10} \times 8.836 \times 10^7 \times 5001 \times 8.808 \times 10^{54}$$
$$U_{g2} \approx 9.4 \times 10^{56} \text{ m/s}^2$$

7. Physics Context

The heliosphere Heaviside term creates a **boundary-enforced U-field**: UQFF predicts gravitational charge coupling (U_{g2}) only activates **beyond the heliopause**. This has an observational implication: spacecraft beyond ~120 AU (Voyager regime) should experience enhanced Ug2-driven deceleration modulated by solar cycle activity ($\delta_{sw} \cdot v_{sw}$), consistent with the Voyager anomalous acceleration observations.

Session 225: Late-Corpus Physics Integration (PAPER_1000-1081)

> *The following physics upgrades incorporate equations, mechanisms, and derivations from the late-corpus papers (Sessions 219-225, PAPER_1000-1081). These represent body-level integrations of phonon physics, buoyancy formulations, and S26(3) Ramanujan corrections into this paper's domain.*

Session 225 Phonon-Physics Upgrade: S26(3) Ramanujan Summation

> *Upgrade from PAPER_1080 (Ramanujan Binomial Expansion Proof) and PAPER_1042 (Mock-Theta Phonon Partition). See also PAPER_1078 (QCalcGeom Master Equation) for BSFG crossover applications.*

The third-order Ramanujan summation $S_{26}^{(3)}$, used throughout the late corpus as the universal 26D coupling factor:

$$S_{26}^{(3)} = \sum_{n=0}^{\infty} \frac{(1/4)_n\,(1/2)_n\,(3/4)_n}{(n!)^3} \cdot \prod_{i=1}^{26} \left[1 + [\mathrm{SSq}] \cdot e^{-\kappa\, i\, n/26}\right]$$

where $(a)_n = a(a+1) \cdot s(a+n-1)$ is the Pochhammer symbol.

Binomial expansion (PAPER_1080): The convergence proof shows:

$$R_n^{(26,3)} = \binom{4n}{n} \cdot \frac{W_{26}(n)}{(4^{4n})} \qquad \text{with} \quad W_{26}(n) = \prod_{i=1}^{26} \left[1 + [\mathrm{SSq}] \cdot e^{-\kappa\, i\, n/26}\right]$$

This sum converges absolutely for $|[\mathrm{SSq}]| < 1$ (satisfied by $[\mathrm{SSq}] = 0.57$) and reduces to the classical Ramanujan $1/\pi$ series when $[\mathrm{SSq}] \to 0$.

VDS/DVP/BSH bridge (PAPER_1069): The 26 layers of $W_{26}(n)$ encode the vacuum density series hierarchy, with each layer i contributing a VDS sub-ratio weighted by the exponential decay $e^{-\kappa\, i\, n/26}$.

Mock-theta connection (PAPER_1042): The phonon partition function $Z_{\mathrm{phonon}} = \sum_n q^{n^2} \cdot W_{26}(n)$ unifies the Ramanujan mock-theta framework with the SCm phonon spectrum.

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **NS-compact** sector of the 9-sector UQFF Lagrangian (see `uqff_{lagrangian\_derivation}.p`

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u \phi_{\text{NS}})(\partial^\mu \phi_{\text{NS}}) - V(\phi_{\text{NS}}) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac,[SCm]}} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\text{NS}}) = \frac{1}{2}m^2\phi_{\text{NS}}^2 + \frac{\lambda}{4!}\phi_{\text{NS}}^4 + \kappa \cdot \rho_{\text{vac,[SCm]}} \cdot \phi_{\text{NS}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \phi_{\text{NS}}} = \nabla^2\phi_{\text{NS}} - (4\pi G\rho_{\text{NS}}/c^2)\phi_{\text{NS}} + \Omega_{\text{spin}}\partial_t\phi_{\text{NS}} = 0}$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER\_877 Axioms} \xrightarrow{\text{DPM + ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{\text{4 forces}} F_{U\_Bi\_i} \xrightarrow{\text{sector E-L}} \delta S/\delta\phi_{\text{NS}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac,[SCm]}}/\rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac,[SCm]}} \cdot \exp\left(-\exp\left(-\frac{r - r_0}{\lambda_{\text{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.182 (near-threshold regime), placing it in the $t \to \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36}$ kg/m3.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 31, \quad n_{\text{channel}} = 11/26$$

Since $p_{\text{DVP}} = 31$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **104 yr** (spin-down equilibrium):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U\_b} \cdot \left(1 - e^{-[SSq]\cdot m/M_\odot}\right) \cdot \cos! \left(\frac{2\pi j}{26}\right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh! \left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.
