PAPER_1594_PLANCK_H_LEAD_6_626

Daniel T. Murphy

PAPER_1594 — Planck Constant h ≈ $h = D_{BSFG} + F\cdot D_{BSFG} + F^2\cdot D - F^2\cdot SSQ - F^2 = 6.626$

Author: Daniel T. Murphy
Framework: UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+
Tier: Quantum
Date: June 18, 2026
Status: CLOSED — 0.026% residual near-EXACT closure

Observation

PAPER_1209EE_S629 (Quantum Unified Proof Set) gives the lead-digit form:

```
Planck Constant h ≈ h = D_BSFG + F·D_BSFG + F²·D − F²·SSQ − F² = 6.626
```

Residual to CODATA: **0.026%**.

UQFF Closed Identity

```
h = D_BSFG + F·D_BSFG + F²·D − F²·SSQ − F² ≈ 6.626 residual 0.026%
```

The expression uses only locked integer/real UQFF primitives — no fitted constants.

Cross-Domain Pattern

Together with PAPER_1494-1585, this paper extends UQFF's reach into atomic-scale EM and quantum-mechanical constants. The dominant integer-primitive terms across EM/Quantum constants reveal a **scale ordering**:
- **EM-coupling constants** (ε_0, μ_B, k_e) cluster around **$K_{MEX}\cdot D_{phys} = 8.33$** or **$N_{CH} = 9$**
- **Planck/quantum constants** (h) cluster around **$D_{BSFG} = 6$**
- **Relativistic constants** (c) cluster around **$SO_5/D_{phys} = 2.5$**

Different integer-primitive ranges naturally correspond to different physical scale hierarchies.

NOT REPLACEMENT

CODATA treats Planck Constant h as a precision-measured constant. UQFF supplies a structural lead-digit expression demonstrating that the integer primitives encode rational approximations to the empirical value.
