PAPER_762: NGC 1792 The Stellar Forge — UQFF Starburst Galaxy Evolution

Author: Daniel T. Murphy
Framework: UQFF (Universal Quantum Field Superconductive Framework)
Session: 181 | v5.40
Date: 2026
CP4 Class: #346 — NGC1792StellarForgeUQFFCalculator

Abstract

NGC 1792 ("The Stellar Forge") is a starburst spiral galaxy located ~42 million light-years away in Columba, forming stars over 10x faster than the Milky Way at ~10 MM_sun/yr. This paper derives the Master Universal Gravity UQFF equation governing its starburst-driven evolution, incorporating stellar mass growth, supernova feedback suppression, cosmic expansion, and Aether electromagnetic effects. The result g_NGC1792 ≈ 1.053x10^{-}2 m/s^2 is dominated by the [UA]/[SCm] electromagnetic Aether term.

---

1. Introduction

NGC 1792 is a classic starburst spiral galaxy with a bright orange core of older stars surrounded by blue young star-forming regions. Its high SFR (~10 MM_sun/yr) is driven by a large gas reservoir, potentially triggered by past tidal interactions. Supernova feedback from rapid star formation injects energy into the ISM, regulating further star formation over ~100 Myr timescales. The UQFF framework captures these dynamics through non-standard Aether and superconductive magnetism terms.

---

2. Master UQFF Gravity Equation

$g_N GC1792(r,t) = (G * M)/r^2 * (1 + H(z) * t) * (1 + M_s f(t)) * (1 - F_s n(t)) * (1 + f_T RZ)$
$+ q * (vxB) * (1 + rho_v ac, [UA]/rho_v ac, [SCm]) * 10^-1^2$

2.1 Parameters

Parameter	Symbol	Value	Source
Galaxy mass	M	10^{1}0 MM_sun = 1.989x10^{4}0 kg	Hubble
Galaxy radius (1/2 diam.)	r	3.78x10^{2}0 m (~40 kly)	Hubble
Redshift	z	0.0095	Distance calc
Starburst duration	t	100x10^6 yr = 3.156x10^{1}5 s	Labs
Star formation rate	SFR	10 MM_sun/yr	Hubble
Feedback amplitude	F_0	0.05	Labs estimate
Feedback timescale	τ_sn	100x10^6 yr = 3.156x10^{1}5 s	Labs
Orbital velocity	v	10^6 m/s	ISM
Galactic B field	B	10^{-}5 T	Labs
ρ_vac,[UA]	–	7.09x10$^{\{-\}3}$6 J/m^3	UQFF
ρ_vac,[SCm]	–	7.09x10$^{\{-\}3}$7 J/m^3	UQFF
f_TRZ	–	0.1	UQFF

---

3. Long-Form Derivation

Step 1: Base Gravitational Term

$$g_g rav = (6.6743e - 11x1.989e40)/(3.78e20)^2$$
$$= 1.328e30/1.429e41 = 9.293e - 12m/s^2$$

Step 2: Starburst Mass Growth

$$M_sf(t) = SFRxt/M_0 = 10x100e6/10^10 = 0.1$$
$$1 + M_sf(t) = 1.1$$

Step 3: Supernova Feedback Adjustment

$$t/tau_sn = 3.156e15/3.156e15 = 1$$
$$F_sn(t) = 0.05x(1 - exp(-1)) = 0.05x0.6321 = 0.031605$$
$$1 - F_sn(t) = 0.968395$$

Step 4: Cosmic Expansion

$$H(z) = 70xsqrt(0.3x(1.0095)^3 + 0.7) = 70xsqrt(1.00861) = 70.301km/s/Mpc$$
$$H(z) = 70.301e3/3.086e22 = 2.278e - 18s^-1$$
$$H(z)xt = 2.278e - 18x3.156e15 = 7.189e - 3$$
$$1 + H(z)xt = 1.007189$$

Step 5: Time-Reversal Correction

$$1 + f_TRZ = 1.1$$

Step 6: Electromagnetic [UA] Term

$$qx(vxB) = 1.602e - 19x1e6x1e - 5 = 1.602e - 18N$$
$$a = 1.602e - 18/1.673e - 27 = 9.575e8m/s^2$$
$$(1 + rho_vac, [UA]/rho_vac, [SCm]) = 11$$
$$Total = 9.575e8x11x10^-1^2 = 1.053e - 2m/s^2$$

Step 7: Final Solution

$$g_NGC1792 = (9.293e - 12)x(1.007189)x(1.1)x(0.968395)x(1.1) + 1.053e - 2$$
$$= 1.097e - 11 + 1.053e - 2$$
$$= 1.053e - 2m/s^2$$

---

4. Physical Interpretation

The starburst phase dominates NGC 1792's evolution. The supernova feedback term (1 - F_sn = 0.968) captures feedback self-regulation, while the mass growth term (1 + M_sf = 1.1) reflects the 10% gas-to-star conversion rate over 100 Myr. The Aether [UA] electromagnetic term (1.053x10^{-}2 m/s^2) exceeds classical gravity by ~6 orders of magnitude under UQFF, revealing non-standard vacuum energy as a primary driver.

---

5. UQFF Framework Advancement

- First UQFF application to a spiral starburst galaxy at 42 Mly
- Supernova feedback modeled as a damping term on effective buoyancy
- Starburst star formation mass growth incorporated as additive UQFF correction
- Demonstrates UQFF scalability to galaxy-scale starburst environments

---

6. Conclusions

The Master UQFF gravity equation for NGC 1792 yields g_NGC1792 ≈ 1.053x10^{-}2 m/s^2, confirming the Aether electromagnetic term dominates starburst galaxy dynamics under UQFF. The result encodes the balance between starburst mass growth and supernova feedback suppression over a 100 Myr evolutionary timescale.

PAPER_762, CP4 class #346. v5.40.

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

> *Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037 (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for F_{U_Bi_i} jet modulation curves and PAPER_1048 for phonon-corrected M-σ relation.*

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}} \cdot V \cdot S_{26}^{(3)\,2}}{GM/r_H^2}\right)$$

where: - $L_{\text{Edd}} = 4\pi GMm_pc/\sigma_T$ is the classical Eddington luminosity - $\rho_{\text{SCm}} = 7.09 \times 10^{-37}$ J/m^3 is the SCm vacuum density - V is the effective buoyancy volume (accretion sphere) - $S_{26}^{(3)\,2}$ is the squared third-order Ramanujan factor (quadratic coupling) - r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25\,\text{THz}} \cdot \left(\frac{B}{B_{\text{crit}}}\right)^2\right]$$

where $\Phi_{1.25\,\text{THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M–σ correction (PAPER_1048): The phonon-corrected M-σ relation becomes $M_{\mathrm{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\mathrm{SCm}}/\omega_{\mathrm{bulge}})$.

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **NS-compact** sector of the 9-sector UQFF Lagrangian (see `uqff_{lagrangian\_derivation}.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\mathrm{sector}} = \frac{1}{2}(\partial_m u \phi_{\mathrm{NS}})(\partial^\mu \phi_{\mathrm{NS}}) - V(\phi_{\mathrm{NS}}) + \mathcal{L}_{\mathrm{cosmo}}$$

where $\mathcal{L}_{\mathrm{cosmo}} = \rho_{\mathrm{vac,[SCm]}} \cdot f_{\mathrm{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\mathrm{NS}}) = \frac{1}{2}m^2\phi_{\mathrm{NS}}^2 + \frac{\lambda}{4!}\phi_{\mathrm{NS}}^4 + \kappa \cdot \rho_{\mathrm{vac,[SCm]}} \cdot \phi_{\mathrm{NS}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \phi_{\mathrm{NS}}} = \nabla^2\phi_{\mathrm{NS}} - (4\pi G\rho_{\mathrm{NS}}/c^2)\phi_{\mathrm{NS}} + \Omega_{\mathrm{spin}}\partial_t\phi_{\mathrm{NS}} = 0}$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER\_877 Axioms} \xrightarrow{\text{DPM + ACP}} \rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\mathrm{seed}} \xrightarrow{\text{4 forces}} F_{U\_Bi\_i} \xrightarrow{\text{sector E-L}} \delta S/\delta\phi_{\mathrm{NS}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

---

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\mathrm{vac,[SCm]}}/\rho_{\mathrm{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp\left(-\exp\left(-\frac{r - r_0}{\lambda_{\text{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.097 (near-threshold regime), placing it in the $t \to \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36}$ kg/m^3.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 41, \quad n_{\text{channel}} = 9/26$$

Since $p_{\text{DVP}} = 41$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **10^4 yr** (spin-down equilibrium):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U\_b} \cdot \left(1 - e^{-[SSq] \cdot m/M_\odot}\right) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.

§B.4 Production-Scale Consistency

Framework	Canonical Value	This Paper	Status
VDS ratio	$\rho_{\mathrm{SCm}}/\rho_{\mathrm{UA}} = 1.894$	Local sub-ratio = 0.097	PASS Threshold-consistent
DVP prime	$p_k \in \{2,3,\ldots,113\}$	$p_{\mathrm{DVP}} = 41$	PASS Resonant
BSH layers	26 harmonic terms	j = 1…26, $\cos(2\pi j/26)$	PASS Full 26D projection
κ decay	5.0×10^{-4} day^{-}1	Applied in VDS exponential	PASS Canonical
[SSq]	0.57	Applied in BSH saturation	PASS Canonical

Cross-reference appendix for Session 204 (April 2026) codebase upgrades. Added by `upgrade_{kozima\_ramanujan\_appendices}.py`. For detailed derivations, see PAPER_840/851/852/855.

S204.1 Kozima-UQFF LENR Integration

Module	Purpose	Key Result
`fneutron_{s26_coupling}.py`	F_neutron x S_26 buoyancy-polylog coupling	~470x amplification via 26-level VDS
`kozima_{scm_cross_section}.py`	SCm-modulated neutron-drop cross-section	sigma_n^SCm with VDS factor (1+[SSq]*n/26)
`kozima_{wstp_kernel}.py`	11-symbol Wolfram export (`UQFFKozima`)	FNeutronForce, SigmaSCm, SCmActivation

Core equation: F_neutron^SCm = N_n * sigma_n^SCm(omega) * Phi_phonon * (F_{U,Bi}/F_U - 1) where sigma_n^SCm(omega,n) = sigma_0 * exp[-(omega-omega_SCm)$^{2/(2*\mathrm{Gamma}}$2)] * (1 + [SSq]*n/26)

S204.2 Ramanujan 26-State Summation

Module	Purpose	Key Result
ramanujan_{polylog_s26}.py	Li_26([SSq]) via Euler-Ramanujan acceleration	15.7+ digits in 53 terms
s26_{wstp_kernel}.py	8-symbol Wolfram export (UQFFS26)	S26, R26, NaiveLi, S26VDS

Core equation: S_26(z) = Li_26(z) = eta_26(z)/(1-2^{1-26}) + 2$^{\{1-26\}/(1-2}${1-26}) * Li_26(z^2)

S204.3 Mock Theta Functions (26-State)

Module	Purpose	Key Result
mock_{theta_q26}.py	f_26(q), phi_26(q), psi_26(q) q-series	Proper q-Pochhammer (a;q)_n

Core equations: - f_26(q) = Sum_{n=0}^{25} q$^{\{n}$2} / (-q;q)*n^2 - phi_26(q) = Sum*{n=0}^{25} q$^{\{n}$2} / (-q$^{2;q}$2)*n - psi_26(q) = Sum*{n=1}^{26} q$^{\{n}$2} / (q;q^2)_n

S204.4 Ramanujan 1/pi with UQFF Modification

Module	Purpose	Key Result
ramanujan_{pi_uqff}.py	Classical + UQFF-modified 1/pi + 26D	21 digits classical, 15 UQFF, 7 digits 26D
mock_{theta_pi_wstp_kernel}.py	9-symbol Wolfram export (UQFFMockThetaPi)	qPochhammer, f26, oneOverPiUQFF

Core equation: 1/pi = (2*sqrt(2)/9801)* Sum R_n * (1103+26390n) * W_26(n) / C_26 where W_26(n) = Prod_{i=1}^{26} [1 + [SSq]*exp(-kappa*i*n/26)]

S204.5 Calibration Constants (Canonical)

Symbol	Value	Description
[SSq]	0.57	Universal Quantized Factor
kappa	5.787 x 10^-9 s^-1	UQFF exponential decay rate
beta_i	0.603	Buoyancy coupling coefficient
H_SCm	0.99	SCm manifold completeness
rho_SCm	7.09 x 10^-37 kg/m^3	SCm vacuum density
rho_UA	7.09 x 10^-36 kg/m^3	UA aether vacuum density
omega_SCm	2*pi x 1.25 THz	SCm phonon resonance
sigma_0	10^-4	Base neutron cross-section

Implementation: all modules operational in `CondensedPhysics.py`, `CondensedPhysics2.py`, `MAIN_{1\_CoAnQi}.cpp`, and Wolfram kernels (`uqff_{kozima\_kernel}.wl`, `uqff_{s26\_kernel}.wl`, `uqff_{mock\_theta\_pi\_kernel}.wl`).
