Abstract

The Buoyancy Gravity Triadic mode evaluates $E_{\text{net}}(t, \Gamma) = S_{26} \cdot \cos(\omega_t extSCmt) \cdot \exp(-\Gamma t) - \text{threshold}$. Positive E_{net} drives expansion (nebulae, HII regions); negative E_{net} drives erosion (filaments, cometary knots).

---

1. Net Energy

$$E_{\text{net}}(t, \Gamma) = S_{26} \cdot \cos(\omega_t extSCm \cdot t) \cdot \exp(-\Gamma \cdot t) - \text{threshold}$$

2. Regime Classification

E_{net}	Regime	Astrophysical Example
> 0.1	Expansion	Nebulae, HII regions
< -0.1	Erosion	Filaments, pillars
[-0.1, 0.1]	Neutral	Transition zones

Session 225 Phonon-Physics Upgrade: UQFF 9-Sector Lagrangian

> *Upgrade from PAPER_1066 (UQFF Lagrangian First Principles) and PAPER_1065 (Buoyancy Lagrangian EOM Variational Derivation).*

The complete UQFF Lagrangian density, from which all sector-specific equations of motion derive:

$$\mathcal{L}_{\text{UQFF}} = \mathcal{L}_{\text{GR}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{phonon}} + \mathcal{L}_{\text{interaction}}$$

$$\mathcal{L}_{\text{SCm}} = \tfrac{1}{2}(\partial_\mu \phi)^2 - \lambda\left(\phi^2 - v_{\text{SCm}}^2\right)^2$$

The SCm condensate potential minimum gives $V(\phi_0) = -7.09 \times 10^{-37}$ J/m^3 (matching ρ_{SCm}) and phonon mass $m_{\text{phonon}} = \sqrt{8\lambda}\, v_{\text{SCm}}$.

Nine-sector closure (Session 202):

$$\mathcal{L}_9 = \mathcal{L}_{\text{EH}} + \mathcal{L}_{\text{YM}} + \mathcal{L}_{\text{Dirac}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{mag}} + \mathcal{L}_{\text{buoy}} + \mathcal{L}_{\text{aether}} + \mathcal{L}_{\text{LENR}} + \mathcal{L}_{\text{KK}}$$
