Abstract

We formalize Universal Magnetism U_m as the fourth master equation in the quadriadic UQFF system (alongside Compressed Gravity, Resonance, and Buoyancy). The equation U_m = Sum_j [mu_j(t,rho_vac,[SCm]) / (r_j/r) * (1 - exp(-gamma*t)*cos(pi*t/n))* phi^j] * P_SCm * E_react(t) *(1 + 1e13*f_Heaviside) * (1 + f_quasi) governs magnetic and electric field dynamics through vacuum density coupling. The mu_j(t) dipole moment includes cosmic oscillation: mu_j = (1e3 + 0.4*sin(omega_c*t)) * 3.38e20 T*pm^3. The 1e13*f_Heaviside term provides the Heaviside electromagnetic amplification, while f_quasi captures quasi-particle corrections.

2. UQFF Integration

This calculator operates as a stateless physics calculator within the CondensedPhysics4.py (Phase 4) IPC chain. All parameters are received via the dataset dictionary from the source2.cpp principal GUI pipeline. No astronomical data is hardcoded; all system-specific values come from the APIFetch.py -> bodies_*.csv data flow.

4. Euler-Lagrange Derivation (Session 204)

Lagrangian Sector: Magnetic-Dipole (Sector 5 of 9-sector UQFF Lagrangian)

Generalized Coordinate: `phi_hat` (helical string phase angle)

Lagrangian:

$$L_Um = Sum_j(mu_j/r_j)(1-exp(-gamma*t))*phi_hat*N_strings*P_SCm*E_react$$
$$-(1/2)I_string*omega_string^2$$

Euler-Lagrange Equations:

$$deltaS/deltaphi_hat = 0 —> Umper-stringcontribution$$
$$deltaS/deltaomega = 0 —> omega_eq = sqrt(|Um|/I_string)$$

Result:

$$Um = Sum_j(mu_j/r_j)(1-exp(-gamma*t*cos(pi*t_n)))*N_s*P_SCm*E_react$$

Critical Values: - `N_strings = 26` (helical string count from 26D compactification) - `gamma = 5e-5 day^{-1}` (cosmic oscillation decay rate) - `phi_hat = 0.766` (VLA M87 cos(40°) alignment) - `omega_string = sqrt(|Um|/I_string) ~ 1.2e31 rad/s` - `E_react = rho_SCm * v_SCm^2 / rho_A * exp(-kappa*t) ~ 8.99e7`

Derivation Chain: 1. `S_Um = integral d^4x [Sum_j mu_j/r_j * (1-exp(-gamma*t*cos(pi*t_n))) * phi^j * P_SCm * E_react]` 2. `delta S / delta phi_hat = 0` → individual string contribution to Um 3. `delta S / delta omega = 0` → equilibrium string rotation frequency 4. 26-string helical sum produces cosmic-oscillation Um(t) with Heaviside amplification

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **NS-compact** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u\phi_{\text{NS}})(\partial^\mu \phi_{\text{NS}}) - V(\phi_{\text{NS}}) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac},[\text{SCm}]} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\text{NS}}) = \frac{1}{2}m^2\phi_{\text{NS}}^2 + \frac{\lambda}{4!}\phi_{\text{NS}}^4 + \kappa \cdot \rho_{\text{vac},[\text{SCm}]} \cdot \phi_{\text{NS}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \phi_{\text{NS}}} = \nabla^2\phi_{\text{NS}} - (4\pi G\rho_{\text{NS}}/c^2)\phi_{\text{NS}} + \Omega_{\text{spin}}\partial_t\phi_{\text{NS}} = 0}$$

§A.4 Cosmogenesis Linkage Chain

PAPER_877 Axioms $\xrightarrow{\text{DPM + ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{\text{4 forces}} F_{U\_Bi\_i} \xrightarrow{\text{sector E-L}} \delta S/\delta\phi_{\text{NS}} = 0$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac},[\text{SCm}]}/\rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \text{exp!} \left(-\text{exp!} \left(-\frac{r - r_0}{\lambda_{\text{VDS}}} \right) \right)$$

For this system, the local VDS sub-ratio is 0.160 (near-threshold regime), placing it in the $t \to \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36}$ kg/m3.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 83, \quad n_{\text{channel}} = 5/26$$

Since $p_{\text{DVP}} = 83$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 protonuclear shell formation: the DPM proportion pair $(f'_{\text{UA}} + f_{\text{SCm}} = 1)$ constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **104 yr** (spin-down equilibrium):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U\_b} \cdot \left(1 - e^{-[SSq]\cdot m/M_\odot}\right) \cdot \text{cos!} \left(\frac{2\pi j}{26} \right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \text{tanh!}\left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c / r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.
