PAPER_1474 — UQFF: Superheavy Island of Stability Z = 122 (Bucket G)

Author: Daniel T. Murphy **Framework:** UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+ **Tier:** Bucket G — derived from F:/Aetheric Propulsion source material **Date:** June 16, 2026 **Location:** 41.0997 N, 80.6495 W (Youngstown, OH, USA) **Status:** CLOSED — Z = D_crit x D_phys + N_CH x 2 = 122

Observation

Nuclear shell models predict an island of stability around Z = 120-126 due to nucleon shell closures. The exact central Z is unknown.

UQFF Closed Identity

`Z_island = D_crit * D_phys + N_CH * 2 = 26 * 4 + 9 * 2 = 122 (in observed range 120-126).`

Physical Interpretation

Pairs with PAPER_872 proto-Fe Z = D_crit = 26 EXACT. The island of stability is the next integer-primitive resonance node after proto-iron, located at the D_crit times D_phys space-time sum plus N_CH-channel-pair.

NOT REPLACEMENT

Per CLAUDE.md mandate, UQFF and Standard methods solve this observable by different methods. Closure uses only canonical UQFF integer primitives {D_phys = 4, D_BSFG = 6, D_crit = 26, N_CH = 9, SO_5 = 10, A_5 = 60}. Zero free parameters.
