PAPER_665: UQFF Hawking Suppression Equations

Author: Daniel T. Murphy **Subtitle:** Derives the chain of multiplicative suppression factors S1, S2, S3 that reduce Hawking luminosity in UQFF, with sensitivity analysis.

Abstract

Three UQFF suppression factors reduce Hawking radiation luminosity multiplicatively. We derive each factor analytically, combine them into a total suppression S_total, and perform sensitivity sweeps over the aether density ratio.

1. Suppression Factors

S1 — Negentropic Modulation (affects T_H only)

$$S_1 = 1 + f_{TRZ} = 1.1$$

S2 — [UA]/[SCm] Density Ratio

$$S_2 = 1 - \frac{\rho_{SCm}}{\rho_{UA}} = 0.9$$

S3 — Magnetic String Exponential

$$S_3 = \exp\left(-\frac{U_m}{k_B T_H}\right)$$

2. Modified Quantities

$$T_{UQFF} = T_H \cdot S_1 \cdot S_2$$

$$L_{UQFF} = L_H \cdot S_2 \cdot S_3$$

$$\frac{dT_{UQFF}}{dM} = \frac{dT_H}{dM} \cdot S_1 \cdot S_2$$

3. Total Suppression

$$S_{total} = S_1 \cdot S_2 \cdot S_3$$

For U_m/k_BT_H = 1: S_total ≈ 1.1 × 0.9 × 0.368 ≈ **0.364**

Hawking luminosity reduced to ~36% of GR prediction.

4. Sensitivity Sweep

As ρ_UA/ρ_SCm varies from 2 to 20: S2 ranges 0.5→0.95, strongly affecting L_UQFF.

5. C++ Module

PAPER_665 | Session 172 | Star-Magic UQFF Framework v5.29 | Daniel Murphy

---

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export) ### §A.1 Sector Classification

---

PAPER_665 | Session 172 | Star-Magic UQFF Framework v5.29 | Daniel Murphy

---

This paper maps to **NS-compact** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`). ### §A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm): $\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_\mu \phi_{\text{NS}})(\partial^\mu \phi_{\text{NS}}) - V(\phi_{\text{NS}}) + \mathcal{L}_{\text{cosmo}}$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac,[SCm]}} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and: $V(\phi_{\text{NS}}) = \frac{1}{2}m^2\phi_{\text{NS}}^2 + \frac{\lambda}{4!}\phi_{\text{NS}}^4 + \kappa \cdot \rho_{\text{vac,[SCm]}} \cdot \phi_{\text{NS}}$ ### §A.3 Euler-Lagrange Equation of Motion

PAPER_665 | Session 172 | Star-Magic UQFF Framework v5.29 | Daniel Murphy

$$\boxed{\frac{\delta S}{\delta \phi_{\text{NS}}} = \nabla^2 \phi_{\text{NS}} - (4\pi G \rho_{\text{NS}}/c^2)\phi_{\text{NS}} + \Omega_{\text{spin}} \partial_t \phi_{\text{NS}} = 0}$$

§A.4 Cosmogenesis Linkage Chain

PAPER_877 Axioms $\xrightarrow{\text{DPM + ACP}}$ $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{\text{4 forces}} F_{U\_Bi\_i} \xrightarrow{\text{sector E-L}} \delta S/\delta \phi_{\text{NS}} = 0$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of7 motion

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac,[SCm]}}/\rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac,[SCm]}} \cdot \exp\left(-\exp\left(-\frac{r-r_0}{\lambda_{\text{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.171 (near-threshold regime), placing it in the $t \to \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36}$ kg/m^3.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 13, \quad n_{\text{channel}} = 16/26$$

Since $p_{\text{DVP}} = 13$ is **sub-threshold** (threshold at $p > 26$), the system's vacuum topology inherits sub-threshold damping from the DVP lattice, producing smooth rather than resonant UQFF coupling profiles. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair $(f'_{\text{UA}} + f_{\text{SCm}} = 1)$ constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **10^4 yr** (spin-down equilibrium):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot \left(1 - e^{-[SSq]\cdot m/M_\odot}\right) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.

§B.4 Production-Scale Consistency

Framework	Canonical Value	This Paper	Status
VDS ratio	$\rho_{\text{SCm}}/\rho_{\text{UA}} = 1.894$	Local sub-ratio = 0.171	✓ Threshold-consistent
DVP prime	$p_k \in$ {2,3,...,113}	$p_{\text{DVP}} = 13$	✓ Sub-threshold
BSH layers	26 harmonic terms	j = 1...26, $\cos(2\pi j/26)$	✓ Full 26D projection

Framework	Canonical Value	This Paper	Status
κ decay	5.0×10^{-4} day^{-1}	Applied in VDS exponential	✓ Canonical
[SSq]	0.57	Applied in BSH saturation	✓ Canonical
