PAPER_745: Crab Nebula MUGE — Expanding Supernova Remnant with Pulsar Wind

Author: Daniel T. Murphy
Framework: Universal Quantum Field Superconductive Framework (UQFF)
Session: 180 continuation | v5.38
Date: 2025
CP4 Class: #329 — CrabNebulaExpandingMUGECalculator

Abstract

The Crab Nebula (M1) is the remnant of SN 1054, powered by a central pulsar (PSR B0531+21) at the highest rotational energy loss in the known neutron star population. Its expanding ejecta (r(t) = r_0 + v_r*t) creates a time-dependent gravitational environment unlike any static system. This paper derives the Crab Nebula MUGE incorporating: the expanding radius r(t), the pulsar wind term F_wind, and the nebular magnetic energy M_mag. The UQFF framework captures both the mechanical expansion and the magnetospheric energy injection that power the synchrotron nebula.

---

1. Introduction

The Crab Nebula is a pulsar wind nebula (PWN) — one of the brightest objects in X-rays and gamma-rays. The central pulsar (P = 33 ms, P = 4.2x10^{-}13 s/s) injects ~5x10^{3}1 W of spin-down power into the nebulae through a relativistic wind. The expanding ejecta shell moves at v_r ~ 1500 km/s, with angular size growing observably over human timescales. This expanding geometry requires r(t) to appear explicitly in the MUGE denominator, making the Crab the canonical example of a time-dependent gravitational radius.

Crab Nebula parameters: - Distance = 2.0 kpc - Age 970 yr (SN 1054) - r_0 (initial remnant radius) 3x10^{1}5 m - r_current 5.6 ly = 5.3x10^{1}6 m - v_r = 1500 km/s = 1.5x10^6 m/s - M_ejecta 4-5 MM_sun - B_nebula 10^{-}4 T (filamentary magnetic field) - L_pulsar = 5x10^{3}1 W (spin-down luminosity) - P_spin = 33 ms

---

2. Crab Nebula MUGE

$$g_Crab(r,t) = (G*M)/r(t)^2*(1+H(z)*t)*(1-B(t)/B_crit)$$
$$+ (U_g1 + U_g2 + U_g3 + U_g4)$$
$$+ U_i$$
$$+ (Lambda*c^2/3)$$
$$+ (hbar/\sqrt{}(Deltax*Deltap))*integral(psi*H*psidV)*(2pi/t_Hubble)$$
$$+ rho_ejecta*V*g$$
$$+ F_wind[pulsarwind—NEW]$$
$$+ M_mag[magneticenergy—NEW]$$

---

3. Time-Dependent Radius r(t)

The expanding radius is the defining feature of the Crab MUGE:

$$r(t) = r_0 + v_r*t$$
$$r_0 = initialradiusatSNexplosion(m)$$
$$v_r = expansionvelocity = 1.5x10^6m/s$$
$$t = timesinceSN1054(s)$$

For t = 970 yr = 3.06x10^{1}0 s:

$$r(970yr) = 3x10^15 + 1.5x10^6x3.06x10^10$$
$$r(970yr)\ = 4.6x10^16m\ = 4.9ly$$

Gravitational deceleration:

$$g_grav(t) = G*M_ejecta/r(t)^2$$
$$g_grav(970yr) = 6.674x10^-1^1x(4x4x1.989x10^30)/(4.6x10^16)^2$$
$$g_grav\ = 5x10^-2^2m/s^2(extremelyweak—expansiondominates)$$

---

4. F_wind — Pulsar Wind Term

The pulsar wind carries relativistic particles outward, creating an inward reaction force equivalent to:

$$F_wind = L_pulsar/(4*pi*r(t)^2*c*M_ejecta)$$
$$L_pulsar = 5x10^31W$$
$$r(t) = currentnebularadius$$
$$c = 3x10^8m/s$$

$$F_wind = 5x10^31/(4*pi*(4.6x10^16)^2*3x10^8*4x1.989x10^30)$$
$$F_wind\ = 4.8x10^-3^0m/s^2(smallbutphysicallysignificantover970yr)$$

Cumulative momentum injection over nebula lifetime:

$$Deltap_wind = L_pulsar * t/c \ = 5x10^31x3x10^10/3x10^8 \ = 5x10^33kg * m/s$$

---

5. M_mag — Magnetic Energy Term

The nebular magnetic field stores and dissipates energy, affecting dynamics:

$$M_mag = B^2/(2 * mu_0 * r(t) * rho_ejecta)[magneticpressuredividedbydensity]$$
$$B = 10^-4T(filamentaryfield)$$
$$mu_0 = 4pix10^-7H/m$$
$$rho_ejecta \ = 10^-2^2kg/m^3(current)$$

$$M_mag = (10^-4)^2/(2 * 4pix10^-7 * 4.6x10^16 * 10^-2^2)$$
$$M_mag \ = 2.7x10^-1^7m/s^2$$

This is the dominant non-DPM-emergent term for the Crab, controlling the synchrotron brightness evolution.

---

6. UQFF Gravity Components

$$U_g1 : Pulsarmagneticdipole$$
mu_dipole_PSR $= 3.8x10^30J/T(fromP,)$
$$B_PSR = 3.8x10^8T(surfacefield)$$
$$U_g1contributesatpulsarvicinityonly$$
$$U_g2 : Superconductiveaetherfieldthreadingnebula$$
$$B_superalignedwithpulsarrotationaxis$$
$$U_g2 \ = 10^5J/m^3(strongnearpulsarwindshock)$$
$$U_g3 : Externalgalacticfieldat2kpc$$
$$U_g3 = G * M_gal/r_gal^2$$
$$U_g4 : Galacticcentercontribution$$
$$k_4 * rho_vac, [SCm] * (M_bh/d_g) * e^(- alphat) * cos(pi * t_n)$$

---

7. Temporal Evolution Summary

Time (yr)	r(t) (ly)	g_grav (m/s^2)	M_mag (m/s^2)
0	0.3	2x10$^{\{-\}1}$4	10$^{\{-\}1}$6
100	1.6	5x10$^{\{-\}2}$1	10$^{\{-\}1}$7
970	4.9	5x10$^{\{-\}2}$2	2.7x10$^{\{-\}1}$7

Time (yr)	r(t) (ly)	g_grav (m/s^2)	M_mag (m/s^2)
10,000	~50	~5x10{-}27	~10{-}19

The magnetic term M_mag remains important relative to g_grav throughout nebula evolution.

---

8. Conclusion

The Crab Nebula MUGE demonstrates that time-dependent radius r(t) is essential for accurately modeling supernova remnant gravity. The F_wind pulsar injection and M_mag magnetic energy terms together dominate over classical DPM-emergent gravity within the nebula. The UQFF successfully models the transition from SN ejecta to mature PWN through its modular environmental forcing framework.

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

> *Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037 (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for F_U_Bi_i jet modulation curves and PAPER_1048 for phonon-corrected M- relation.*

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}} \cdot V \cdot S_{26}^{(3)\,2}}{GM/r_H^2}\right)$$

where: - $L_{\text{Edd}} = 4\pi GMm_p c/\sigma_T$ is the classical Eddington luminosity - $\rho_{\text{SCm}} = 7.09 \times 10^{-37}$ kg/m^3 is the SCm vacuum density - V is the effective buoyancy volume (accretion sphere) - $S_{26}^{(3)\,2}$ is the squared third-order Ramanujan factor (quadratic coupling) - r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25\,\text{THz}} \cdot \left(\frac{B}{B_{\text{crit}}}\right)^2\right]$$

where $\Phi_{1.25\,\text{THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M– correction (PAPER_1048): The phonon-corrected M- relation becomes $M_{\text{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}}/\omega_{\text{bulge}})$.

Session 225 Phonon-Physics Upgrade: UQFF 9-Sector Lagrangian

> *Upgrade from PAPER_1066 (UQFF Lagrangian First Principles) and PAPER_1065 (Buoyancy Lagrangian EOM Variational Derivation).*

The complete UQFF Lagrangian density, from which all sector-specific equations of motion derive:

$$\mathcal{L}_{\text{UQFF}} = \mathcal{L}_{\text{GR}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{phonon}} + \mathcal{L}_{\text{interaction}}$$

$$\mathcal{L}_{\text{SCm}} = \tfrac{1}{2}(\partial_\mu \phi)^2 - \lambda(\phi^2 - v_{\text{SCm}}^2)^2$$

The SCm condensate potential minimum gives $V(\phi_0) = -7.09 \times 10^{-37}$ J/m^3 (matching ρ_{SCm}) and phonon mass $m_{\text{phonon}} = \sqrt{8\lambda}\, v_{\text{SCm}}$.

Nine-sector closure (Session 202):

$$\mathcal{L}_9 = \mathcal{L}_{\text{EH}} + \mathcal{L}_{\text{YM}} + \mathcal{L}_{\text{Dirac}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{mag}} + \mathcal{L}_{\text{buoy}} + \mathcal{L}_{\text{aether}} + \mathcal{L}_{\text{LENR}} + \mathcal{L}_{\text{KK}}$$

Sector	Domain	Late-Corpus Result
1 (EH)	General Relativity	Canonical Einstein-Hilbert
2 (YM)	Yang-Mills gauge	$m_{\text{gap}} = 5970$ GeV (PAPER_1005)
3 (Dirac)	Fermion / LENR	Kozima neutron-drop (PAPER_1061)
4 (SCm)	Superconducting manifold	$V(\phi_0) = -\rho_{\text{SCm}}$ canonical
5 (Mag)	Um magnetism	Heaviside amplifier (PAPER_1072)
6 (Buoy)	F_U_Bi_i buoyancy	Variational EOM (PAPER_1065)
7 (Aether)	Vacuum background	Two-component ρ (PAPER_1051)
8 (LENR)	Nuclear transmutation	COP parametric (PAPER_1081)
9 (KK)	Kaluza-Klein 26D	$S^{(3)}_{26}$ compactification (PAPER_1080)

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **NS-compact** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`)

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u \phi_{\text{NS}})(\partial^\mu \phi_{\text{NS}}) - V(\phi_{\text{NS}}) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac,[SCm]}} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\mathrm{NS}}) = \frac{1}{2}m^2\phi_{\mathrm{NS}}^2 + \frac{\lambda}{4!}\phi_{\mathrm{NS}}^4 + \kappa \cdot \rho_{\mathrm{vac,[SCm]}} \cdot \phi_{\mathrm{NS}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \phi_{\mathrm{NS}}} = \nabla^2\phi_{\mathrm{NS}} - (4\pi G\rho_{\mathrm{NS}}/c^2)\phi_{\mathrm{NS}} + \Omega_{\mathrm{spin}}\partial_t\phi_{\mathrm{NS}} = 0}$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER\_877 Axioms} \xrightarrow{\text{DPM + ACP}} \rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\mathrm{seed}} \xrightarrow{\text{4 forces}} F_{U\_Bi\_i} \xrightarrow{\text{sector E-L}} \delta S/\delta\phi_{\mathrm{NS}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

---

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\mathrm{vac,[SCm]}}/\rho_{\mathrm{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\mathrm{vac}}(r) = \rho_{\mathrm{vac,[SCm]}} \cdot \exp!\left(-\exp!\left(-\frac{r - r_0}{\lambda_{\mathrm{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.065 (near-threshold regime), placing it in the $t \to \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} = 7.799 \times 10^{-36}$ kg/m^3.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\mathrm{DVP}} = 101, \quad n_{\mathrm{channel}} = 18/26$$

Since $p_{\mathrm{DVP}} = 101$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\mathrm{UA}} + f_{\mathrm{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **10^4 yr** (spin-down equilibrium):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U\_b} \cdot \left(1 - e^{-[SSq] \cdot m/M_\odot}\right) \cdot \cos! \left(\frac{2\pi j}{26}\right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh! \left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.

§B.4 Production-Scale Consistency

Framework	Canonical Value	This Paper	Status
VDS ratio	$\rho_{\text{SCm}}/\rho_{\text{UA}} = 1.894$	Local sub-ratio = 0.065	PASS Threshold-consistent
DVP prime	$p_k \in \{2,3,...,113\}$	$p_{\text{DVP}} = 101$	PASS Resonant
BSH layers	26 harmonic terms	j = 1...26, cos($2\pi j/26$)	PASS Full 26D projection
decay	5.0×10^{-4} day^{-}1	Applied in VDS exponential	PASS Canonical
[SSq]	0.57	Applied in BSH saturation	PASS Canonical
