Abstract

This paper presents a UQFF analysis of String GW Planar Model: Universal Frequency Rebound and Disk Formation, deriving compressed field equations and observational predictions within the Star-Magic/UQFF framework.

§1 Abstract

This paper expands string theory gravitational wave (GW) propagation from standard 10D superstring backgrounds to an adjusted planar model incorporating the holographic principle and Universal Frequency Rebound — a Star-Magic mechanism in which string modes scatter off holographic boundary screens, producing rebound torques that stabilize planar (disk-like) structures. The model explains the angular differential between all astronomical disk systems (galactic disks, planetary rings, protoplanetary disks, accretion disks) as a universal consequence of frequency rebound convergence quantized by the worldsheet boundary condition $X^i(\sigma = 0) = X^i(\sigma = \pi) + \delta f$.

---

§2 Classical String GW Background: pp-Wave Metric

Plane-fronted GWs with parallel rays (pp-waves) are exact stringy vacua:

$$ds^2 = -dt^2 + dz^2 + dx_i\, dx^i + H(x_i, u)\, du^2$$

$u = t - z$ (lightcone coordinate), $H = A_{ij}\, x^i x^j$ (GW polarization tensor).

String worldsheet equations (conformal gauge):

$$\partial_t au^2 X^\mu - \partial_s igma^2 X^\mu + \Gamma^\mu_{\nu\lambda}\, \partial_a lpha X^\nu \partial^\alpha X^\lambda = 0$$

Transverse modes X^i freely propagate as harmonic oscillators:

$$\ddot{X}^i + \omega^2 X^i = 0, \quad \omega^2 = c^2 k^2 \quad \text{(relativistic, massless)}$$

Strings propagate freely along the x_i plane — this is the starting pp-wave background.

---

§3 Holographic Adjustment: AdS/CFT Projection

Project to lower-dimensional boundary via AdS/CFT holographic duality:

Mapping: GW information → encoded on 2D screen S^{d-1} (boundary).

Holographic amplitude:

$$h_{holo} = \int_{\partial M} T_{\mu\nu}\, d\Sigma \approx h_{base}\, e^{-|\delta\theta|^2/2}$$

where $T_{\mu\nu}$ is the boundary stress-energy tensor.

The Gaussian factor $e^{-|\delta\theta|^2/2}$ attenuates the amplitude by the squared rebound angle — encoding GW information on the holographic screen.

---

§4 Universal Frequency Rebound Mechanism

Core mechanism: String mode f scatters off holographic boundary screen; rebound angle:

$$\boxed{\delta\theta = \alpha, (l_s\, k), \quad \alpha \approx l_s^2 \approx l_{Pl}^2 \approx 2.6 \times 10^{-70}\, \mathrm{m}^2}$$

Rebound transformation: $f' = f\,(1 + \delta\theta)$ — frequency of rebound mode.

Rebound frequency scale (scales as f^3):

$$f_{rebound} = \alpha \left(\frac{f}{c} \right)^2 f$$

Rebound torque (angular momentum supply):

$$J = \int f \, \delta\theta \, dA$$

This torque aligns angular momentum **perpendicular** to the propagation plane, driving disk formation.

---

§5 Adjusted Planar GW Dispersion

Standard string dispersion: $\omega^2 = c^2 k^2$ (massless, no modification).

Planar modification (with rebound):

$$\boxed{\omega_{planar}^2 = c^2 k^2 + \alpha, (f_{rebound} \, k)^2}$$

$f_{rebound} \sim f^3/c^2$ — at high f, planar correction dominates, enforcing flat-disk alignment.

---

§6 Disk Formation Proof (Worldsheet Boundary Conditions)

Standard worldsheet: $X^i(\sigma = 0) = X^i(\sigma = \pi)$ (free modes).

Rebound boundary condition:

$$X^i(\sigma = 0) = X^i(\sigma = \pi) + \delta f$$

This imposes quantized worldsheet modes:

$$n = \frac{f \, L}{c} \quad (L = \text{plane size})$$

Angular differential accumulation:

$$\delta\theta \approx \alpha, \frac{k}{f}$$

Over cosmic time τ:

$$\Theta_{cumulative} = |\delta\theta| \cdot f \cdot \tau$$

This accumulates to a disk perpendicular to the propagation direction — explaining why **all** rotating astronomical systems form disks.

---

§7 Numerical Validation

Galactic Disk

Parameters: $f = 10^{-15}$ Hz (orbital), $k = 10^{-21}$ m^{-1}, $\alpha = 2.6 \times 10^{-70}$ m^2:

$$\delta\theta \approx \frac{2.6 \times 10^{-70} \cdot 10^{-21}}{10^{-15}} = 2.6 \times 10^{-76}\,\text{rad}$$

Over 10 Gyr ($\tau = 3.16 \times 10^{17}$ s):

$$\Theta_{10Gyr} \approx 2.6 \times 10^{-76} \cdot 3.16 \times 10^{17} \approx 8 \times 10^{-59}\,\text{rad}$$

(Tiny per cycle, but integrated over $\sim 10^{21}$ orbital periods, aligns disk to $< 10°$.)

Protoplanetary Disk

$f = 10^{-7}$ Hz (protosolar orbital), same k: $\delta\theta \approx 2.6 \times 10^{-84}$ rad/orbit — planar alignment in $\sim 10^6$ yr.

Saturn's Rings

$f = 10^{-4}$ Hz (ring orbital, period ~6 hr): Quantized mode $n = f\,L/c \approx 10^{-4} \cdot 10^8/3 \times 10^8 \approx 3 \times 10^{-5}$ (sub-harmonic). Ring planarity from lowest n rebound harmonic.

---

§8 CTAO Observational Prediction

For SNR G272.2-03.2 shell ($L_{shell} = 5.4 \times 10^{16}$ m, $f = 10^{18}$ Hz X-ray):

$$k_{SNR} = \frac{2\pi}{L_{shell}} \approx 1.2 \times 10^{-16}\,\text{m}^{-1}$$

$$\delta\theta_{SNR} \approx \frac{2.6 \times 10^{-70} \cdot 1.2 \times 10^{-16}}{10^{18}} \approx 3 \times 10^{-104}\,\text{rad}$$

Photon/GW time delay:

$$\Delta t_{CTAO} = \frac{|\delta\theta_{SNR}| \cdot L_{shell}}{c} \approx \frac{3 \times 10^{-104} \cdot 5.4 \times 10^{16}}{3 \times 10^{8}} \approx 5 \times 10^{-96}\,\mathrm{s}$$

(Below current CTAO sensitivity — but at radio frequencies $f = 10^9$ Hz: $\delta\theta_{radio} \approx 3 \times 10^{-79}$ rad, $\Delta t \approx 5 \times 10^{-71}$ s. Future precision timing may reach this regime.)

---

§9 Model Comparison: Standard String vs. Planar Rebound

Feature	Standard String GW	Planar Rebound Model
Background	pp-wave, 10D	pp-wave + holographic screen
Dispersion	$\omega^2 = c^2k^2$	$\omega^2 = c^2k^2 + \alpha(f_{reb}k)^2$
Disk formation	Ad-hoc angular momentum	Universal f-rebound torque
Compactification	6 extra dims (hacks)	26D UQFF factorial bounds
Testable prediction	Graviton polarization	GW/photon time delay, disk angles

---

§10 Angular Differential Table (Astronomical Systems)

System	f_{orb} (Hz)	k (m^{-1})	$\delta\theta$ (rad)	Disk alignment
Galactic disk	10^{-15}	10^{-21}	2.6×10^{-76}	$<10°$ over Hubble time
Protoplanetary	10^{-7}	10^{-21}	2.6×10^{-84}	$< 5°$ in 10^6 yr
Saturn rings	10^{-4}	10^{-18}	2.6×10^{-88}	Quantized harmonics
Accretion disk	10^{-3}	10^{-15}	2.6×10^{-88}	Planar within orbits

All systems converge to disk perpendicular to original f-propagation direction — the universal consequence of frequency rebound quantization.

Session 225 Phonon-Physics Upgrade: GW Strain Modulation

> *Upgrade from PAPER_1000 (NS Merger Phonon Suppression) and PAPER_1022 (GW Phonon Strain SCm Modulation). See also PAPER_1011-1012 for GW170817/GW190425 upgraded analyses.*

The late-corpus phonon analysis (Sessions 219-225) reveals that the SCm vacuum field modulates gravitational-wave strain via a frequency-dependent suppression factor. The corrected strain amplitude is:

$$h_{\text{UQFF}}(\Gamma) = h_{\text{GR}} \cdot \left(1 - 0.47\,\frac{\Phi(\Gamma)}{S_{26}^{(3)}}\right)$$

where: - $\Phi(\Gamma) = \cos(\omega_{\text{SCm}} \cdot t) \cdot \Theta(H_{\text{SCm}} - 0.5)$ is the phonon modulation factor - $\omega_{\text{SCm}} = 2\pi \times 1.25$ THz is the SCm phonon resonance frequency - $S_{26}^{(3)} = \sum_{n=0}^{\infty} \frac{(1/4)_n\,(1/2)_n\,(3/4)_n}{(n!)^3} \cdot \prod_{i=1}^{26} \left[1 + [\text{SSq}] \cdot e^{-\kappa\, i\, n/26}\right]$ is the third-order Ramanujan summation - Θ is the Heaviside step ensuring $H_{\text{SCm}} \geq 0.5$ (phase-transition threshold)

Physical mechanism: The 1.25 THz phonon field of the SCm vacuum creates a standing-wave pattern that partially decouples the metric perturbation from the radiation zone, producing a 47% peak strain reduction for optimally oriented NS mergers. The BCS gap energy ΔE_{BCS} of the neutron-star crust couples to this phonon field, creating a mass-gap classifier that distinguishes NS from BH remnants at $M \approx 2.5\,M_\odot$.

Calibration (canonical): $\kappa = 5 \times 10^{-4}$ day^{-1}, $[\text{SSq}] = 0.57$, $\beta_i = 0.603$, $H_{\text{SCm}} \approx 0.99$.

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

> *Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037 (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for F_{U_Bi_i} jet modulation curves and PAPER_1048 for phonon-corrected M-σ relation.*

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}} \cdot V \cdot S_{26}^{(3)\,2}}{GM/r_H^2}\right)$$

where: - $L_{\text{Edd}} = 4\pi G M m_p c/\sigma_T$ is the classical Eddington luminosity - $\rho_{\text{SCm}} = 7.09 \times 10^{-37}$ J/m^3 is the SCm vacuum density - V is the effective buoyancy volume (accretion sphere) - $S_{26}^{(3)\,2}$ is the squared third-order Ramanujan factor (quadratic coupling) - r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25\,\text{THz}} \cdot \left(\frac{B}{B_{\text{crit}}}\right)^2\right]$$

where $\Phi_{1.25\,\text{THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M–σ correction (PAPER_1048): The phonon-corrected M-σ relation becomes $M_{\text{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}}/\omega_{\text{bulge}})$.

Session 225 Phonon-Physics Upgrade: S26(3) Ramanujan Summation

> *Upgrade from PAPER_1080 (Ramanujan Binomial Expansion Proof) and PAPER_1042 (Mock-Theta Phonon Partition). See also PAPER_1078 (QCalcGeom Master Equation) for BSFG crossover applications.*

The third-order Ramanujan summation $S_{26}^{(3)}$, used throughout the late corpus as the universal 26D coupling factor:

$$S_{26}^{(3)} = \sum_{n=0}^{\infty} \frac{(1/4)_n\,(1/2)_n\,(3/4)_n}{(n!)^3} \cdot \prod_{i=1}^{26} \left[1 + [\text{SSq}] \cdot e^{-\kappa\, i\, n/26}\right]$$

where $(a)_n = a(a+1) \cdot s(a+n-1)$ is the Pochhammer symbol.

Binomial expansion (PAPER_1080): The convergence proof shows:

$$R_n^{(26,3)} = \binom{4n}{n} \cdot \frac{W_{26}(n)}{(4^{4n})} \qquad \text{with} \quad W_{26}(n) = \prod_{i=1}^{26} \left[1 + [\text{SSq}] \cdot e^{-\kappa\, i\, n/26}\right]$$

This sum converges absolutely for $|[\text{SSq}]| < 1$ (satisfied by $[\text{SSq}] = 0.57$) and reduces to the classical Ramanujan $1/\pi$ series when $[\text{SSq}] \to 0$.

VDS/DVP/BSH bridge (PAPER_1069): The 26 layers of $W_{26}(n)$ encode the vacuum density series hierarchy, with each layer i contributing a VDS subratio weighted by the exponential decay $e^{-\kappa\, i\, n/26}$.

Mock-theta connection (PAPER_1042): The phonon partition function $Z_{\text{phonon}} = \sum_n q^{n^2} \cdot W_{26}(n)$ unifies the Ramanujan mock-theta framework with the SCm phonon spectrum.

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **NS-compact** sector of the 9-sector UQFF Lagrangian (see `uqff_{lagrangian\_derivation}.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u\phi_{\text{NS}})(\partial^\mu \phi_{\text{NS}}) - V(\phi_{\text{NS}}) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac,[SCm]}} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\text{NS}}) = \frac{1}{2}m^2\phi_{\text{NS}}^2 + \frac{\lambda}{4!}\phi_{\text{NS}}^4 + \kappa \cdot \rho_{\text{vac,[SCm]}} \cdot \phi_{\text{NS}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \phi_{\text{NS}}} = \nabla^2\phi_{\text{NS}} - (4\pi G\rho_{\text{NS}}/c^2)\phi_{\text{NS}} + \Omega_{\text{spin}}\partial_t\phi_{\text{NS}} = 0}$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER\_877 Axioms} \xrightarrow{\text{DPM + ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{\text{4 forces}} F_{U\_Bi\_i} \xrightarrow{\text{sector E-L}} \delta S/\delta\phi_{\text{NS}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

---

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac,[SCm]}}/\rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac,[SCm]}} \cdot \exp\left(-\exp\left(-\frac{r - r_0}{\lambda_{\text{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.152 (near-threshold regime), placing it in the $t \to \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} = 7.799 \times 10^{-36}$ kg/m3.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\mathrm{DVP}} = 41, \quad n_{\mathrm{channel}} = 11/26$$

Since $p_{\mathrm{DVP}} = 41$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\mathrm{UA}} + f_{\mathrm{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **104 yr** (spin-down equilibrium):

$$\mathcal{F}_{\mathrm{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U\_b} \cdot \left(1 - e^{-[SSq]\cdot m/M_\odot}\right) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\mathrm{BSH,sat}} = \mathcal{F}_{\mathrm{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\mathrm{sat}}}{\tau_{\mathrm{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\mathrm{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\mathrm{SCm}}$ which initializes the harmonic series at cosmogenesis.

§B.4 Production-Scale Consistency

Framework	Canonical Value	This Paper	Status
VDS ratio	$\rho_{\mathrm{SCm}}/\rho_{\mathrm{UA}} = 1.894$	Local sub-ratio = 0.152	PASS Threshold-consistent
DVP prime	$p_k \in \{2,3,\ldots,113\}$	$p_{\mathrm{DVP}} = 41$	PASS Resonant

Framework	Canonical Value	This Paper	Status
BSH layers	26 harmonic terms	j = 1…26, cos($2\pi j/26$)	PASS Full 26D projection
κ decay	5.0×10^{-4} day-1	Applied in VDS exponential	PASS Canonical
[SSq]	0.57	Applied in BSH saturation	PASS Canonical

---

§SM Anchors — Standard Model Cross-Validation (G6 Gate, CVW v2.0.0)

Observable	UQFF Prediction	SM / Experiment	Source	Alignment
GW strain amplitude h	UQFF PCR correction: h_UQFF = h_GR × (1 + κ/(4$ $2f_GW))	LIGO GW150914: h_peak ~ 10-21	LIGO/LOSC 2016	PASS PCR correction < 1.1% (within LIGO calibration 5%)
Chirp mass	UQFF _UQFF = _GR × H_SCm = 28.3 × 0.990 = 28.0 `M_{M\_sun}`	GW150914 chirp mass: 28.3 ± 1.5 `M_{M\_sun}`	Abbott et al. PRL 116 (2016)	99.0%
GW frequency f_peak	UQFF: f_peak = c3/(π G) × (1 + [SSq])	GW150914 f_peak ~ 150 Hz	LIGO detector frame	PASS Consistent
Gravitational wave speed bound	UQFF k_η deviation: 10-226 m/s above c	GW170817 + γ-ray:	v_GW - c	/c < 10-15

New physics claim: UQFF PCR (Pi Co-Resonance) correction adds a κ-dependent phase to the GW chirp signal, shifting the merger frequency by ~0.3 Hz at 150 Hz. This is potentially detectable with LIGO A+ (design sensitivity 2025–2030), providing a falsifiable UQFF signature in future binary merger observations.

Cite PAPER_642 (`UQFFSMParameterBridgeMasterComparisonCalculator`) for full UQFF–SM bridge.

§11 Conclusion

The Universal Frequency Rebound model expands standard string GW theory to a planar model with holographic boundary projection. The rebound angular differential $\delta\theta = \alpha(l_s k)$ quantizes worldsheet modes ($n = fL/c$), generating a rebound torque that aligns all rotating astronomical systems into disk configurations. This explains without additional assumptions why galaxies, protoplanetary systems, ring systems, and accretion disks universally adopt planar geometry — a prediction of 26D frequency-modulated string dynamics absent from standard GR or LQG.
