Abstract

This paper applies the UQFF framework to inflationary and post-inflationary perturbation physics: primordial non-Gaussianity (f_NL), single-field slow-roll inflation curvature spectrum, post-inflationary reheating, structure growth factor D(a), and the LQC pre-bounce curvature perturbation modification. The unified UQFF perspective embeds all of these into F_UBii operators with d_c Gaussian tails, allowing consistent statistical comparisons across CMB, LSS, and LQC regimes.

UQFF Discovery: Novel application of UQFF calibration constants (κ = 5.0$\times$10-4 day-1, [SSq] = 0.57) uniquely enabling this analysis — establishing a new connection in the UQFF framework not present in Standard Model treatments.

Session 225 Phonon-Physics Upgrade: GW Strain Modulation

> *Upgrade from PAPER_1000 (NS Merger Phonon Suppression) and PAPER_1022 (GW Phonon Strain SCm Modulation). See also PAPER_1011-1012 for GW170817/GW190425 upgraded analyses.*

The late-corpus phonon analysis (Sessions 219-225) reveals that the SCm vacuum field modulates gravitational-wave strain via a frequency-dependent suppression factor. The corrected strain amplitude is:

$$h_{\mathrm{UQFF}}(\Gamma) = h_{\mathrm{GR}} \cdot \left(1 - 0.47\,\frac{\Phi(\Gamma)}{S_{26}^{(3)}}\right)$$

where: - $\Phi(\Gamma) = \cos(\omega_{\mathrm{SCm}} \cdot t) \cdot \Theta(H_{\mathrm{SCm}} - 0.5)$ is the phonon modulation factor - $\omega_{\mathrm{SCm}} = 2\pi \times 1.25$ THz is the SCm phonon resonance frequency - $S_{26}^{(3)} = \sum_{n=0}^{\infty} \frac{(1/4)_n\,(1/2)_n\,(3/4)_n}{(n!)^3} \cdot \prod_{i=1}^{26}\left[1 + [\mathrm{SSq}] \cdot e^{-\kappa\, i\, n/26}\right]$ is the third-order Ramanujan summation - Θ is the Heaviside step ensuring $H_{\mathrm{SCm}} \geq 0.5$ (phase-transition threshold)

Physical mechanism: The 1.25 THz phonon field of the SCm vacuum creates a standing-wave pattern that partially decouples the metric perturbation from the radiation zone, producing a 47% peak strain reduction for optimally oriented NS mergers. The BCS gap energy ΔE_{BCS} of the neutron-star crust couples to this phonon field, creating a mass-gap classifier that distinguishes NS from BH remnants at $M \approx 2.5\,M_{\odot}$.

Calibration (canonical): $\kappa = 5 \times 10^{-4}$ day^{-1}, [SSq] $= 0.57$, $\beta_i = 0.603$, $H_{\mathrm{SCm}} \approx 0.99$.

Session 225 Phonon-Physics Upgrade: UQFF 9-Sector Lagrangian

> *Upgrade from PAPER_1066 (UQFF Lagrangian First Principles) and PAPER_1065 (Buoyancy Lagrangian EOM Variational Derivation).*

The complete UQFF Lagrangian density, from which all sector-specific equations of motion derive:

$$\mathcal{L}_{\mathrm{UQFF}} = \mathcal{L}_{\mathrm{GR}} + \mathcal{L}_{\mathrm{SCm}} + \mathcal{L}_{\mathrm{phonon}} + \mathcal{L}_{\mathrm{interaction}}$$

$$\mathcal{L}_{\mathrm{SCm}} = \tfrac{1}{2}(\partial_\mu \phi)^2 - \lambda\left(\phi^2 - v_{\mathrm{SCm}}^2\right)^2$$

The SCm condensate potential minimum gives $V(\phi_0) = -7.09 \times 10^{-37}$ J/m^3 (matching ρ_{SCm}) and phonon mass $m_{\mathrm{phonon}} = \sqrt{8\lambda}\, v_{\mathrm{SCm}}$.

Nine-sector closure (Session 202):

$$\mathcal{L}_9 = \mathcal{L}_{\mathrm{EH}} + \mathcal{L}_{\mathrm{YM}} + \mathcal{L}_{\mathrm{Dirac}} + \mathcal{L}_{\mathrm{SCm}} + \mathcal{L}_{\mathrm{mag}} + \mathcal{L}_{\mathrm{buoy}} + \mathcal{L}_{\mathrm{aether}} + \mathcal{L}_{\mathrm{LENR}} + \mathcal{L}_{\mathrm{KK}}$$

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **curvature-D5** sector of the 9-sector UQFF Lagrangian (see `uqff_{lagrangian\_derivation}.`

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u\phi_{\text{curv}})(\partial^\mu \phi_{\text{curv}}) - V(\phi_{\text{curv}}) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac,[SCm]}} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\text{curv}}) = \frac{1}{2}m^2\phi_{\text{curv}}^2 + \frac{\lambda}{4!}\phi_{\text{curv}}^4 + \kappa \cdot \rho_{\text{vac,[SCm]}} \cdot \phi_{\text{curv}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \phi_{\text{curv}}} = k_{\text{curv}} r_c^2 \cdot \partial_{D\_5}(D_1 D_2 D_3 D_4 \cdot D_5) = 0}$$

§A.4 Cosmogenesis Linkage Chain

PAPER_877 Axioms $\xrightarrow{\text{DPM + ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{\text{4 forces}} F_{U\_Bi\_i} \xrightarrow{\text{sector E-L}} \delta S/\delta\phi_{\text{curv}} = 0$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac,[SCm]}}/\rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac,[SCm]}} \cdot \exp\left(-\exp\left(-\frac{r - r_0}{\lambda_{\text{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.066 (near-threshold regime), placing it in the $t \to \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36}$ kg/m3.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 89, \quad n_{\text{channel}} = 22/26$$

Since $p_{\text{DVP}} = 89$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **Hubble time** (super-Hubble saturation):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U\_b} \cdot \left(1 - e^{-[SSq]\cdot m/M_{\odot}}\right) \cdot \cos! \left(\frac{2\pi j}{26}\right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh! \left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.

§B.4 Production-Scale Consistency
