Abstract

The MUGE Compressed gravity framework extends Newtonian gravity with 9 physics-motivated corrections spanning expansion, magnetic suppression, envelope, Ug-sum, cosmological constant, quantum, fluid, and dark matter perturbation effects. `validate_uqff_muge.py` validates the complete 10-term sum for 5 astrophysical systems (Sgr A*, M87, Sun, NeutronStar, Magnetar), confirming no NaN/Inf across 8 distinct radial ranges and 5 mass scales.

1. The 10-Term MUGE Compressed Framework

3. Dominant Corrections by Scale

Galactic Scale (r ~ kpc = 3 × 10? m)

At galactic radius r = 1 kpc from Sgr A*:

Dominant corrections	Relative magnitude
d_DM Perturbation	~10? (DM halo)
d_Expansion	~10?5 (sub-dominant at kpc)
d_Ug_sum	~10?7

? Dark matter perturbation dominates at galaxy scales. MUGE compressed reduces to DM+Newton.

Cosmological Scale (r ~ Gpc)

Dominant corrections	Relative magnitude
d_Expansion	~10? (Hubble flow)
d_Cosm	~10? (dark energy)

? Expansion and ? dominate at Gpc. MUGE compressed ? ?CDM-concordant.

4. Cross-System Validation (validate_uqff_muge.py)

All 5 systems from validator, all 10 MUGE terms verified finite:

System	M (kg)	r_test (m)	g_MUGE (m/s)	NaN/Inf
Sgr A*	8.0×106	1.27×10	234.3	None
M87*	1.26×104	1.95×10	2.21×10	None
Sun	1.99×10	6.96×108	274.3	None

System	M (kg)	r_test (m)	g_MUGE (m/s)	NaN/Inf
NeutronStar	2.8×10	1.2×104	1.62×10	None
Magnetar	3.0×10	1.2×104	1.74×10	None

5. Relationship to UQFF_CompressedCalculator

The `UQFF_CompressedCalculator` (Paper #89) wraps the MUGE Compressed result and adds the d_Ug factor:

$$F_{\text{Comp}}^{\text{UQFF}}(r,t) = g_{\text{MUGE}}^{\text{Comp}}(r) + \delta_{\text{Ug}}(r,t)$$

Where d_Ug includes all 4 Ugk terms evaluated in the UQFF framework (not just their sum).

Summary

Scale	Dominant correction(s)	MUGE expansion
Near-horizon	d_Ug_sum + d_Perturbation	UQFF – GR
Galactic (kpc)	d_DM (0.1 g_N)	Dark matter-driven
Cosmological (Gpc)	d_Expansion + d_Cosm	?CDM-concordant
All scales	No NaN/Inf (5 systems)	Numerically stable

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\mathrm{vac},[\mathrm{SCm}]}/\rho_{\mathrm{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\mathrm{vac}}(r) = \rho_{\mathrm{vac},[\mathrm{SCm}]} \cdot \exp\left(-\exp\left(-\frac{r-r_0}{\lambda_{\mathrm{VDS}}}\right)\right)$$

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

For this system, the local VDS sub-ratio is 0.167 (near-threshold regime), placing it in the $t \to \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice: $p_{\text{DVP}} = 2, \quad n_{\text{channel}} = 13/26$

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

Since $p_{\mathrm{DVP}} = 2$ is **sub-threshold** (threshold at $p > 26$), the system's vacuum topology inherits its sub-threshold damping from the DVP lattice, producing smooth rather than resonant UQFF coupling profiles. The DVP framework

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **10^3 yr** (field decay quiescence):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot \left(1 - e^{-[SSq]\cdot m/M_\odot}\right) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

The tanh saturation envelope prevents unphysical divergence: $\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}}\right)\right)$

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.
