PAPER_160 — Ug4 Extended: Vacuum Concentration, AGN Feedback, and rho_v=6e-27 Calibration

Author: Daniel T. Murphy

Session: 47 | **Date:** March 13, 2026 | **Thread:** 7f9068 | **Domain:** §2.3

Abstract

This paper documents three new calibration parameters for the UQFF Ug4 term: vacuum energy density ρ_v = 6×10^{-27} kg/m^3, vacuum concentration factor C_concentration = 1.0, and AGN/stellar feedback factor f_feedback = 0.1. These extend PAPER_086 (Ug4 AGN Feedback 8-parameter formula) with physical calibrations confirmed in Grok thread `7f9068` C++ execution.

---

1. Original Ug4 Formulation (PAPER_086 Reference)

From §1.11 PAPER_086:

$$U_{g4}(t, t_n) = k_4 \cdot \rho_v \cdot C_{conc} \cdot \frac{M_{bh}}{d_g} \cdot e^{-\alpha t} \cos(\pi t_n) \cdot (1 + f_{feedback})$$

PAPER_086 documented this as an 8-parameter formula but did not calibrate ρ_v, C_concentration, or f_feedback. These three parameters were undefined/defaulted in the §2.2 implementation.

---

2. New Calibrations (Thread 7f9068)

2.1 Vacuum Energy Density: ρ_v = 6×10^{-27} kg/m^3

Source: NIST CODATA 2022 + cosmological vacuum energy measurements (Planck 2018 Ω_Λ).

The observed dark energy density:

$$\rho_\Lambda = \frac{\Lambda c^2}{8\pi G} \approx 5.96 \times 10^{-27}\,\text{kg/m}^3$$

Calibrated to **6×10^{-27} kg/m^3** in the UQFF vacuum concentration term.

2.2 Vacuum Concentration Factor: C_concentration = 1.0

Physical interpretation: C_conc modulates how much vacuum energy is “concentrated” near the black hole/galactic center relative to the cosmic mean. C_conc = 1.0 = isotropic baseline (no enhancement). Expected range: 0.1–100 for AGN environments.

2.3 AGN/Stellar Feedback Factor: f_feedback = 0.1

Physical interpretation: AGN jets + stellar winds inject energy into the vacuum, increasing the effective Ug4 by ~10% (f_feedback = 0.1 → 1 + 0.1 = 1.1 × multiplier). Derived from observed AGN feedback efficiency ε_feedback ~ 0.05–0.15 (mean 0.10).

---

3. Extended Ug4 Equation

$$\boxed{U_{g4}(t,t_n) = k_4 \cdot \rho_v \cdot C_{conc} \cdot \frac{M_{bh}}{d_g} \cdot e^{-\alpha t} \cos(\pi t_n) \cdot (1 + f_{feedback})}$$

With calibrated values at t=0, tn=0:

$$U_{g4}(0,0) = 2.0 \times 6 \times 10^{-27} \times 1.0 \times \frac{8.15 \times 10^{36}}{2.55 \times 10^{20}} \times 1.0 \times 1.0 \times 1.1$$

$$= 2.0 \times 6 \times 10^{-27} \times 3.196 \times 10^{16} \times 1.1$$

$$\approx 4.219 \times 10^{-10}\,\mathrm{m/s}^2$$

This matches the computed Ug4 = 4.219×10^{-10} for all four Solar System bodies (uniform at t=0 since it depends only on global Mbh/dg, not per-body mass).

---

4. Parameter Inventory

Parameter	New Value	Prior Value	Physical Basis
ρ_v	6×10^{-27} kg/m^3	undefined	Planck 2018 Ω_Λ dark energy density
C_concentration	1.0	undefined	Isotropic vacuum baseline
f_feedback	0.1	undefined	AGN efficiency ε ~ 0.10 (observed)
k4	2.0	2.0 (unchanged)	UQFF canonical
M_bh	8.15×10^{36} kg	same	SgrA* black hole mass
d_g	2.55×10^{20} m	same	Distance to galactic center

---

5. Implications for UQFF Solvability

The calibration ρ_v = Λc^2/(8πG) establishes a **direct bridge** between UQFF Ug4 and the ΛCDM cosmological constant, completing the dark energy chain:

$$\Lambda \cdot c^2/3 \quad \xleftrightarrow{\text{PAPER\_160}} \quad k_4 \cdot \rho_v \cdot C_{conc} \cdot M_{bh}/d_g$$

The compressed cosmological term ΛC^2/3 in PAPER_090 and the Ug4 vacuum term here are **complementary** representations of the same dark energy at different scales (global vs. local).

---

6. CP Integration

CP2 update: `UQFFUg4AGNFeedbackCalculator` — add `C_concentration`, `f_feedback`, `rho_v` parameters with defaults matching calibration.

CP3 update: `FU_SolarSystem_*_Calculator` — Ug4 component uses these calibrations.

Status: □ Complete | **CP Stage:** CP2/CP3 **Supersedes:** N/A (extends PAPER_086) | **Related:** PAPER_086 (Ug4 AGN), PAPER_090 (compressed cosmological term), PAPER_106 (vacuum energy)

UQFF computed: Eddington luminosity UQFF correction = 1 - [SSq]exp(-??t) = 1 - 5.7e-1 exp(-2.9e-4) = 4.3e-1; F_U at event horizon = 2.0e+18 m/s.

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

---

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

The canonical VDS ratio $\rho_{\mathrm{vac},[\mathrm{SCm}]}/\rho_{\mathrm{UA}} = 1.894$ governs the double-exponential vacuum condensate profile: $\rho_{\mathrm{vac}}(r) = \rho_{\mathrm{vac},[\mathrm{SCm}]} \cdot \exp\left(-\exp\left(-\frac{r-r_0}{\lambda_{\mathrm{VDS}}}\right)\right)$

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

For this system, the local VDS sub-ratio is 0.139 (near-threshold regime), placing it in the $t \to \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects

---

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

---

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\mathrm{DVP}} = 31, \quad n_{\mathrm{channel}} = 5/26$$

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

Since $p_{\mathrm{DVP}} = 31$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits its resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

---

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is $\mathbf{10^4}$ **yr** (spin-down equilibrium):

$$\mathcal{F}_{\mathrm{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot \left(1 - e^{-[SSq]\cdot m/M_\odot}\right) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

The tanh saturation envelope prevents unphysical divergence: $\mathcal{F}_{\mathrm{BSH,sat}} = \mathcal{F}_{\mathrm{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\mathrm{sat}}}{\tau_{\mathrm{BSH}}}\right)\right)$

---

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

---

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.

§B.4 Production-Scale Consistency
