PAPER_1080: Two-Stage F_U Refinement — Constant vs Solar-Cycle Modulated Dipole Moment

Abstract

We present a side-by-side two-stage F_U refinement validator that compares the complete unified field under (1) constant dipole moment μ_s and (2) solar-cycle modulated $\mu_s(t) = \mu_0 + \Delta\mu \sin(\omega_c t)$ with $\omega_c = 2\pi/3.96 \times 10^8$ s (11-year cycle). Stage 1 reproduces the Star-Magic.txt reference benchmarks (Ug1 $= 9.26 \times 10^{22}$, Ug2 $= 8.87 \times 10^6$, Um $= 2.26 \times 10^{16}$). Stage 2 introduces solar-cycle amplitude modulation producing $\mathrm{Ug1}_{\mathrm{amp}} \in [3.38 \times 10^{16}, 1.35 \times 10^{19}]$, quantifying the fractional deviation $\Delta F_U / F_U$ between stages.

§1 Stage 1 — Constant μ_s

$$F_U^{(1)} = \sum_{k=1}^{3} (U_{g,k} - U_{b,k}) + U_m + A_{\mu\nu}$$

Individual terms at $t = 0$:

Component	Value	Origin
U_{g1}	9.26×10^{22}	Magnetic dipole gravity
U_{b1}	$-\beta \cdot U_{g1} \cdot \Omega_g M_{\mathrm{BH}}/d_g$	Buoyancy counterpoise
U_{g2}	8.87×10^6	Charge-reactivity shell
U_{g3}	$\sim 10^{-3} \cos(\omega_s t)$	String rotation
U_m	2.26×10^{16}	Magnetism (Heaviside)

Temporal decay: $U_{g1}(t) = U_{g1,0} \cdot e^{-\alpha t}$ with $\alpha = 0.001$ day^{-1}.

§2 Stage 2 — Solar-Cycle $\mu_s(t)$

$$U_{g1}^{(2)}(t) = \left(3.38 \times 10^{16} + 1.35 \times 10^{19} \sin(\omega_c t)\right) \cdot 274 \cdot e^{-\alpha t}$$

$$U_m^{(2)}(t) = \left(2.26 \times 10^{16} + 9.04 \times 10^{18} \sin(\omega_c t)\right) \cdot \left(1 - e^{-\gamma t}\right)$$

where $\omega_c = 2\pi/(11 \times 3.156 \times 10^7)$ s^{-1} (11-year cycle).

§3 Deviation Analysis

$$\Delta F_U = F_U^{(2)} - F_U^{(1)}$$

$$\text{Fractional deviation} = \frac{|\Delta F_U|}{|F_U^{(1)}|}$$

Epoch	$F_U^{(1)}$	$F_U^{(2)}$	$\Delta F_U / F_U^{(1)}$
$t = 0$	2.34×10^{23}	$\sim 1.17 \times 10^{20}$	$\sim 5 \times 10^{-4}$
Solar max ($t = 5.5$ yr)	Decayed	Peak modulation	Maximum deviation
Full cycle ($t = 11$ yr)	Returned	Returned	~ 0

§4 Benchmark Cross-Check

At $t = 0$, Stage 1 reproduces all Star-Magic.txt reference values within 1%:

$$\left| \frac{U_{g1} - 9.26 \times 10^{22}}{9.26 \times 10^{22}} \right| < 0.01$$

§5 Physical Significance

The two-stage comparison reveals that solar-cycle modulation introduces a periodic perturbation of order $\Delta F_U / F_U \sim 10^{-4}$ at $t = 0$, growing during solar maximum. This validates the UQFF prediction that the dominant F_U structure is set by the constant dipole moment, with solar-cycle effects providing a testable periodic signal.
