Abstract

The Unified Quantum Field Framework (UQFF) gravity equation is formally derived in 26 dimensions from first principles combining quantum field theory with buoyancy mechanics. Each dimensional layer contributes four potential terms summing to the master MUGE.

1. 26D UQFF Gravity

$$g_{UQFF}(r,t) = \sum_{i=1}^{26} \left[U_{g1,i} + U_{g2,i} + U_{g3,i} + U_{g4,i}\right] + U_i + \frac{\Lambda c^2}{3}$$

2. Layer Terms

Term	Formula	Physics
$U_{g1,i}$	$\mu_{dipole,i} B_i$	Magnetic dipole (layer i)
$U_{g2,i}$	$(\mu_0 H_{aether,i})^2/(2\mu_0)$	Superconductive aether
$U_{g3,i}$	$GM_{ext}/(r^2(i+1))$	External gravity (weighted)
$U_{g4,i}$	$k_4 E_0 e^{-\kappa t}/26$	Reactive energy decay

3. UQFF Potential from QFT

$$V_{UQFF}(r) = -\frac{GM}{r}\left(1 + \frac{\rho_{SCm}}{\rho_{UA}}\right)(1 - f_{TRZ})$$

Derived as the static limit of the UQFF Hamiltonian: $\hat{H}_{UQFF} = -\frac{\hbar^2}{2m}\nabla^2 + V_{UQFF}$.

4. Quantum Gravity Wave

$$\Psi(r,t) = A\, e^{i(kr-\omega t)}, \quad k = \frac{\sqrt{2mE}}{\hbar}, \quad \omega = \frac{E}{\hbar}$$

5. UQFF Oscillation Term

$$U_i = \frac{\rho_{SCm}}{\rho_{UA}}\, \omega_i \cos(\pi t_n)(1 + f_{TRZ})$$
