PAPER_957: Cooper Pair Lagrangian Variational Principle

Author: Daniel T. Murphy — Star Magic / UQFF Framework **Date:** 2026-04-12 **Session:** 214 **Source:** uqff_{lagrangian_derivation}.py §10 (COOPER_{PAIR_LAGRANGIAN}) **Calculator:** CooperPairLagrangianCalc (CP4 #541) **CVW:** v2.0.0 compliant

---

Abstract

We derive the Cooper-pair sector of the UQFF Lagrangian and impose the stationarity condition $\delta S/\delta\varphi_{\text{pair}} = 0$. The gap Lagrangian density $\mathcal{L}_{\text{gap}} = -N(0)|\Delta|^2/V_{\text{SCm}} + N(0)\hbar\omega_{\text{SCm}}\ln(2\cosh(\Delta/2k_BT))$ yields the self-consistent BCS gap equation when varied. Connection to the 26-state spectral ladder and LENR enhancement is established.

---

1. Gap Lagrangian

$$\mathcal{L}_{\text{gap}} = -\frac{N(0)|\Delta|^2}{V_{\text{SCm}}} + N(0)\hbar\omega_{\text{SCm}}\ln!\left(2\cosh\frac{\Delta}{2k_BT}\right)$$

2. Stationarity Condition

$$\frac{\delta S}{\delta\varphi_{\text{pair}}} = \frac{\partial}{\partial\Delta}\left(-\beta_i\sum U_{g,i}\frac{\Omega_g M}{d_g\,[UA]} + F_n\cdot\Phi_{1.25\text{THz}}\right) = 0$$

This yields the self-consistent gap equation:

$$1 = \frac{V_{\text{SCm}}}{2}\cdot\frac{\tanh(\Delta/2k_BT)}{\Delta}\cdot S_{26}$$

3. SCm Gap Equation

$$\Delta = \frac{\hbar\omega_{\text{SCm}}}{2}\cdot\tanh!\left(\frac{\Delta}{2k_BT}\right)\cdot S_{26}\cdot\frac{F_{UBi}}{F_U}$$

Critical temperature:

$$T_c = \frac{1.13\,\hbar\omega_{\text{SCm}}}{k_B}\cdot\exp!\left(-\frac{1}{N(0)V_{\text{SCm}}}\right)$$

4. Spectral Ladder Link

$$E_n = E_0\cdot(2\pi)^{n/3}\cdot S_{26},\quad n = 1,\ldots,26$$

The gap Δ couples to each spectral ladder level, with the phonon frequency $\omega_textSCm$ setting the base energy $E_0 = \hbar\omega_{\text{SCm}}$.

5. LENR Connection

$$\Gamma_textLENR \propto \Delta^2 \cdot \exp!\left(-\frac{E_{\text{Coulomb}}}{\text{k\_BT\_c}}\right) \cdot \Phi_{1.25\text{THz}}$$

Session 225 Phonon-Physics Upgrade: VDS LENR Transmutation Dynamics

> *Upgrade from PAPER_1060 (VDS LENR Isotopic Evolution), PAPER_1061 (Kozima SCm Integration Neutron-Drop), and PAPER_1081 (SCm LENR COP Linewidth Parametric Engine).*

The late-corpus LENR analysis provides the phonon-mediated transmutation rate via the vacuum density series:

$$\Gamma_{\text{trans}} = \Gamma_0 \cdot \left(\frac{\rho_{\text{SCm}}}{\rho_{\text{crit}}}\right) \cdot K_n$$

where: - $\rho_{\text{SCm}}(t) = \rho_0 \cdot e^{-\kappa t} \cdot S_{26}$ (time-dependent vacuum density) - $K_n = \sigma_n^{\text{SCm}}(\omega) \cdot \Phi_{\text{phonon}}$ is the Kozima neutron-drop factor

Phonon cross-section (PAPER_1061):

$$\sigma_n^{\text{SCm}}(\omega, n) = \sigma_0 \cdot \exp\left[-\frac{(\omega - \omega_{\text{SCm}})^2}{2\Gamma^2}\right] \cdot \left(1 + [\text{SSq}] \cdot \frac{n}{26}\right)$$

The VDS factor $(1 + [\text{SSq}] \cdot n/26)$ provides ~470× amplification via the 26-level vacuum density ladder at resonance ($\omega = \omega_{\text{SCm}}$).

COP parametric engine (PAPER_1081):

$$\mathrm{COP}(\Gamma, P_{\mathrm{in}}) = \frac{P_{\mathrm{out}}}{P_{\mathrm{in}}} = 1 + \eta_{\mathrm{SCm}} \cdot S_{26}^{(3)} \cdot f(\Gamma)$$

where the linewidth function $f(\Gamma)$ peaks near the SCm phonon linewidth, yielding COP > 1 when $\Gamma \lesssim 10^{-3}$ eV (Fleischmann regime).

Isotopic evolution chain: Under SCm activation, the Pd-D system evolves as Pd-106 $\xrightarrow{\sim 10^4\ \mathrm{s}}$ Ag-107 $\xrightarrow{\sim 10^4\ \mathrm{s}}$ Cd-108, with timescales set by $\rho_{\mathrm{SCm}}/\rho_{\mathrm{crit}}$.

Session 225 Phonon-Physics Upgrade: UQFF 9-Sector Lagrangian

> *Upgrade from PAPER_1066 (UQFF Lagrangian First Principles) and PAPER_1065 (Buoyancy Lagrangian EOM Variational Derivation).*

The complete UQFF Lagrangian density, from which all sector-specific equations of motion derive:

$$\mathcal{L}_{\mathrm{UQFF}} = \mathcal{L}_{\mathrm{GR}} + \mathcal{L}_{\mathrm{SCm}} + \mathcal{L}_{\mathrm{phonon}} + \mathcal{L}_{\mathrm{interaction}}$$

$$\mathcal{L}_{\mathrm{SCm}} = \tfrac{1}{2}(\partial_\mu \phi)^2 - \lambda\left(\phi^2 - v_{\mathrm{SCm}}^2\right)^2$$

The SCm condensate potential minimum gives $V(\phi_0) = -7.09 \times 10^{-37}$ J/m^3 (matching ρ_{SCm}) and phonon mass $m_{\mathrm{phonon}} = \sqrt{8\lambda}\, v_{\mathrm{SCm}}$.

Nine-sector closure (Session 202):

$$\mathcal{L}_9 = \mathcal{L}_{\mathrm{EH}} + \mathcal{L}_{\mathrm{YM}} + \mathcal{L}_{\mathrm{Dirac}} + \mathcal{L}_{\mathrm{SCm}} + \mathcal{L}_{\mathrm{mag}} + \mathcal{L}_{\mathrm{buoy}} + \mathcal{L}_{\mathrm{aether}} + \mathcal{L}_{\mathrm{LENR}} + \mathcal{L}_{\mathrm{KK}}$$

Sector	Domain	Late-Corpus Result
