WOLFRAM_TERM: `RSC_UQFF:a_sc_freq=hbar*f_super*f_DPM*a_DPM/(E_vac*c); A_sc=6.994e21; SCm=1-B/B_crit->0 at B->B_crit`

Abstract

This paper presents UQFF derivations and numerical results for: PAPER_289: Cooper-DPM Dual-Frequency SC Synthesis — ħ×f_super×f_DPM Triple-Mode Quantum Product (A_sc = 6.994×10^{21}). Calibration constants: κ = 0.0005/day, [SSq] = 0.57. Results validated against observational data and prior UQFF whitepaper series.

1. Discovery Statement

The UQFF SC-frequency term couples **Cooper pair quantum energy** (ħ × f_super) to DPM resonance through the plasmotic vacuum, creating a **triple-mode quantum product**:

$$a_{\text{sc\_freq}} = \frac{\hbar \cdot f_{\text{super}} \cdot f_{\text{DPM}} \cdot a_{\text{DPM}}}{E_{\text{vac}} \cdot c}$$

with SC amplification factor:

$$A_{\text{sc}} = \frac{\hbar \cdot f_{\text{super}} \cdot f_{\text{DPM}}}{E_{\text{vac}} \cdot c} = 6.994 \times 10^{21}$$

The **full UQFF Resonance-SC** corrects all resonance modes by the Meissner factor:

$$g_{\text{res\_sc}}(t, B) = a_{\text{res\_total}} \cdot \underbrace{\left(1 - \frac{B}{B_{\text{crit}}}\right)}_{\text{SCm}} \cdot (1 + f_{\text{TRZ}})$$

At **B** $\to$ **B_crit**: SCm $\to$ 0 — the **UQFF Resonance-Channel Meissner Gravity Quench**.

This is the **first UQFF module** applying the Meissner quench to a *pure resonance channel* (previous PAPER_266 HUDF applied it to the full gravity sum of a galactic module).

---

2. Physical Equations

2.1 Cooper Pair Quantum Energy

$$E_{\text{Cooper}} = \hbar \cdot f_{\text{super}} = 1.0546 \times 10^{-34} \times 1.411 \times 10^{16}$$

$$\boxed{E_{\text{Cooper}} = 1.488 \times 10^{-18}\,\text{J} = 9.29\ \text{eV}}$$

This energy sits at the extreme-UV / near-X-ray boundary, corresponding to the Cooper pair pairing energy at the magnetar critical field B_crit = 10^{11} T frequency scale.

2.2 SC Amplification Factor

$$A_{\text{sc}} = \frac{E_{\text{Cooper}} \cdot f_{\text{DPM}}}{E_{\text{vac}} \cdot c} = \frac{1.488 \times 10^{-18} \times 10^{12}}{7.09 \times 10^{-36} \times 3 \times 10^{8}}$$

$$\boxed{A_{\text{sc}} = \frac{1.488 \times 10^{-6}}{2.127 \times 10^{-28}} = 6.994 \times 10^{21}}$$

The three coupled modes are: 1. **Cooper pair** at f_super = 1.411×10^{16} Hz (UV-energy superconductor frequency) 2. **DPM resonance** at f_DPM = 1×10^{12} Hz (THz plasma dipole mode) 3. **Plasmotic vacuum** E_vac = 7.09×10^{-36} J/m^3 (vacuum energy normalization)

2.3 SC Frequency Acceleration

$$a_{\text{sc\_freq}} = A_{\text{sc}} \times a_{\text{DPM}} = 6.994 \times 10^{21} \times 3.545 \times 10^{-18}$$

$$a_{\text{sc\_freq}} \approx 2.479 \times 10^{4}\ \text{m/s}^2$$

This large value is physically modulated by the Meissner correction at high B fields.

---

3. Meissner Gravity Quench

3.1 SC Correction

$$\text{SCm} = 1 - \frac{B}{B_{\text{crit}}}$$

B (T)	B/B_crit	SCm	g_res_sc / a_res
1×10^{-5} (ISM)	1×10^{-16}	≈1.0	1.10
1×10^{7} (neutron star crust)	1×10^{-4}	0.9999	1.10
5×10^{10} (near magnetar)	0.5	0.5	0.55
9×10^{10}	0.9	0.1	0.11
1×10^{11} = B_crit	1.0	0.0	**0** (quench)

3.2 Time-Reversal Amplification

At all fields, the (1 + f_TRZ) = 1.1 factor (f_TRZ = 0.1) adds a 10% time-reversal enhancement. At B = 0: g_res_sc = 1.1 × a_res_total (maximum resonance contribution).

3.3 Resonance-Channel Meissner Quench

The UQFF Resonance-Channel Meissner Quench differs from PAPER_266 (HUDF galactic Meissner) in:

Feature	PAPER_266 (HUDF)	PAPER_289 (RSC)
Applied to	Full galaxy g_total sum	Pure resonance a_res sum
System	Cosmic deep field z=3.5	Universal resonance module
B_crit	10^{11} T	10^{11} T
SCm form	1-B/B_crit	1-B/B_crit
Novel aspect	First galactic SC quench	First **resonance-specific** SC quench

The RSC module demonstrates that the Meissner quench acts *selectively* on resonance channels — a clear prediction: in magnetar environments where B $\approx$ B_crit, the resonance-SC gravity contribution is completely suppressed while non-resonant gravitational terms (Newtonian, Λ) remain unaffected.

---

4. Triple-Mode Coupling Interpretation

The product ħ × f_super × f_DPM represents **sum-frequency generation in the quantum vacuum**:

- ħ × f_super = Cooper pair energy quantum (UV regime, 9.29 eV)
- ħ × f_DPM = DPM energy quantum = $1.0546\times10^{-34} \times 10^{12} = 1.055\times10^{-22}$ J = 6.6×10^{-4} eV (far-IR)
- Product: $\hbar^2$ × f_super × f_DPM = two-photon energy product (UV × THz)

Normalizing by E_vac × c gives the gravity acceleration coupling rate — the UQFF vacuum acts as the **phase-matching medium** for this UV-THz parametric interaction.

This is analogous to parametric downconversion in nonlinear optics, but in the UQFF gravitational vacuum: a UV Cooper-pair photon and a THz DPM phonon are coupled through the plasmotic vacuum to produce a gravitational acceleration signature.

---

5. UQFF Parameters

Quantity	Symbol	Value
Cooper pair energy	E_Cooper = ħ×f_super	1.488×10^{-18} J (9.29 eV)
SC amplification	A_sc	6.994×10^{21}
SC frequency term	a_sc_freq	2.479×10^{4} m/s^2
DPM seed	a_DPM	3.545×10^{-18} m/s^2
Meissner quench field	B_crit	10^{11} T
TRZ enhancement	(1+f_TRZ)	1.1
Full factor (B≈0)	A_sc×(1+f_TRZ)	7.693×10^{21}

---
