2026-01-01

PAPER_476 — DPM Pre-Big Bang 26-Sphere Birth Model

Author: Daniel T. Murphy

Abstract

The Dimensional Progenitor Model (DPM) describes the pre-Big Bang quantum state as 26 spherical shells embedded in a unit hypersphere, each encoding a binary quantum level. The [SCm] field provides 10^{4}2 J of binding energy across the shell structure, while the [UA] field decays exponentially during inflation. This paper derives the 26-sphere geometry, the energy budget, the resonance factor linking DPM states to gravitational output, and the connection to the 26-dimensional framework pervading UQFF physics.

---

1. Introduction

The DPM answers the question: what was the pre-Big Bang quantum state? The UQFF answer is that the primordial spacetime comprised 26 spherical shells on a unit hypersphere, with each shell representing one quantum electromagnetic level. This is not merely numerology — the 26 emerges from the dimensionality of bosonic string theory and provides the natural binary encoding for the UQFF field hierarchy.

---

2. The 26-Sphere Geometry

2.1 Unit Sphere Equation

Each sphere k ∈ {1, …, 26} satisfies:

$$(x - h_k)^2 + (y - k_k)^2 + (z - l_k)^2 = r_k^2$$

where (h__k, k__k, l__k) are the center coordinates of sphere k on the unit hypersphere S^{2}5 (25-sphere boundary of 26D space), and r__k is the sphere's radius.

In the canonical DPM configuration: - **All spheres initially coincide** at the origin (h=k=l=0, r=1 normalized) - **Inflation separates them** along independent dimensional axes - **26 directions** = 26 bosonic degrees of freedom

2.2 26-Sphere Volume Sum

$$V_{DPM} = \sum_{k=1}^{26} \frac{4}{3}\pi r_k^3$$

At Big Bang: r__k = r__Planck = 1.616e-35 m -> V__DPM = 26 x (4/3)π r__P^3 ≈ 7.24e-104 m^3

---

3. Energy Budget

3.1 [SCm] Binding Energy

The superconducting medium provides binding energy across the 26-shell structure:

$$E_{SCm} = [SCm]_{amount} \times A_{CP,massive}$$

where $A_{CP,massive}$ is the massive compact-Planck coupling area.

Canonical value: $E_{SCm} \approx 10^{42}$ J

This is approximately the gravitational binding energy of the Milky Way, placing the DPM energy scale at galactic energies — consistent with UQFF's galactic calibration.

3.2 [UA] Energy Decay

During inflation, the [UA] field decays:

$$E_{UA}(t) = E_{UA,0} \times e^{-\gamma t}$$

with $\gamma \approx$ 0.001 s^{-}1 (inflationary damping rate) and $E_{UA,0}$ = 10^{4}5 J (initial energy).

At t_inflation $\approx$ 10{-}32 s: $E_{UA} \approx 10^{45} \times e^{-10^{-35}} \approx 10^{45}$ J (barely decayed)

At t = 10 Gyr: $E_{UA} \approx 10^{45} \times e^{-\gamma \times 3x10^{17}} \approx$ negligible -> present vacuum density ρ_vac_UA = 7.09e-36 J/m^3

3.3 Resonance Factor

DPM states couple to gravity through:

$$R_{DPM} = \frac{GM}{r^2} \times q_{Higgs} \times H_{support} \approx 10^{-11} \text{ (normalized)}$$

where q_{Higgs} is the Higgs field coupling fraction and $H_{support}$ is the DPM-Higgs resonance support factor. At r = 1 m, M = 1 kg: R = G $\approx$ 6.67e-11 $\approx$ 10{-}10.

---

4. Binary Encoding in 26 Levels

4.1 Level Classification

The 26 spheres divide into two groups:

Group	Levels	State	Energy
+1/2 states	1-13	Low-energy EM channel	E_SCm/2
-1/2 states	14-26	High-energy SC barriers	E_SCm x H_barrier

Physical interpretation: - +1/2 states: Standard electromagnetic photons + UQFF Ug1-Ug4 fields - **-1/2 states**: High-energy superconducting barriers that prevent quantum decoherence

$$\Delta E_{barrier} = E_{SCm} \times H_{SCm} \approx 10^{42} \times 0.99 \approx 9.9 \times 10^{41} \text{ J}$$

4.2 26D Binary Coupling

Each of the 26 levels provides a binary EM coupling:

$$C_k = \begin{cases} +1 & \text{if level } k \text{ is active} \\ 0 & \text{if level } k \text{ is inactive} \end{cases}$$

The total coupling: $C_{total} = \sum_{k=1}^{26} C_k/26 \in [0, 1]$

At present universe: $C_{total} \approx [SSq] = 0.57$ – exactly 15 of 26 levels active.

---

5. Connection to Present-Day UQFF

The DPM initial conditions propagate to present physics as:

DPM feature	Present UQFF parameter
26 spheres	26-layer compressed gravity framework (SOURCE115)
SCm binding E = 10^{4}2 J	[SSq] = 0.57 calibration
[UA] decay rate γ	ρ_vac_UA = 7.09e-36 J/m^3
+1/2 / -1/2 states	Ug fields vs. buoyancy fields
Resonance factor R	κ = 0.0005/day DPM coupling
Binary encoding	$k_\eta = 10^{\text{\{-\}}1}$\{1\}3 suppression

---

6. Mathematical Derivation

6.1 DPM Gravitational Output

$$g_{DPM}(r,t) = R_{DPM} \times [SCm]^{26} \times e^{-\gamma t} = \frac{GMq_H H_s}{r^2}[SSq]^{26}e^{-\gamma t}$$

At t=0 (Big Bang): $g_{DPM} \approx GMq_H H_s/r^2 \approx g_{Newton}$ (DPM reduces to DPM-seeded at birth)

At t = 13.8 Gyr: $g_{DPM} \approx g_{Newton} \times (0.57)^{26} \times e^{-small} \approx 10^{-7} g_{Newton}$

This 10^{-}7 suppression is the origin of the UQFF quantum correction term a_DPM = κ [SSq] g in the resonance MUGE equation.

6.2 DPM Momentum Term

$$F_{DPM,mom} = \frac{d}{dt}\left[\sum_{k=1}^{26} m_k v_k\right] = \sum_{k=1}^{26} \frac{GMm_k}{r^2}C_k$$

This feeds directly into the F_{U_Bi_i} integral as F_DPM,mom.

---

7. Observational Predictions

The DPM makes the following testable predictions:

1. **CMB power spectrum**: 26-sphere geometry -> specific l-multipole oscillations at l = 26, 52, 78
2. **Gravitational wave background**: 26D collapse -> specific GW frequency spectrum

3. **Dark matter mass spectrum**: -1/2 states -> SM-neutral particles at E = E_SCm/26 ≈ 3.8e40 J/particle
4. **Vacuum energy fine-tuning**: ρ_Λ / ρ_DPM = $10^{\{-\}9}$0 naturally from exp(-γ t_age) decay

---

8. Conclusion

The DPM provides a pre-Big Bang origin model for the 26-dimensional structure underlying UQFF physics. The 26 spheres encode binary quantum levels, the [SCm] field stores 10^{4}2 J of binding energy, and the [UA] decay drives the transition from primordial high-energy to present low-energy vacuum. The model is mathematically self-consistent within the UQFF framework and makes testable predictions for the CMB, dark matter spectrum, and vacuum energy problem.

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

> *Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037 (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for F_{U_Bi_i} jet modulation curves and PAPER_1048 for phonon-corrected M-σ relation.*

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\mathrm{Edd}}^{\mathrm{UQFF}} = L_{\mathrm{Edd}} \cdot \left(1 + \frac{\rho_{\mathrm{SCm}} \cdot V \cdot S_{26}^{(3)\,2}}{GM/r_H^2}\right)$$

where: - $L_{\mathrm{Edd}} = 4\pi GMm_p c/\sigma_T$ is the classical Eddington luminosity - $\rho_{\mathrm{SCm}} = 7.09 \times 10^{-37}$ J/m^3 is the SCm vacuum density - V is the effective buoyancy volume (accretion sphere) - $S_{26}^{(3)\,2}$ is the squared third-order Ramanujan factor (quadratic coupling) - r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\mathrm{jet}}^{\mathrm{UQFF}} = P_{\mathrm{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25\,\mathrm{THz}} \cdot \left(\frac{B}{B_{\mathrm{crit}}}\right)^2\right]$$

where $\Phi_{1.25\,\mathrm{THz}} = \cos(\omega_{\mathrm{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M–σ correction (PAPER_1048): The phonon-corrected M-σ relation becomes $M_{\mathrm{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\mathrm{SCm}}/\omega_{\mathrm{bulge}})$.

Session 225 Phonon-Physics Upgrade: UQFF 9-Sector Lagrangian

> *Upgrade from PAPER_1066 (UQFF Lagrangian First Principles) and PAPER_1065 (Buoyancy Lagrangian EOM Variational Derivation).*

The complete UQFF Lagrangian density, from which all sector-specific equations of motion derive:

$$\mathcal{L}_{\mathrm{UQFF}} = \mathcal{L}_{\mathrm{GR}} + \mathcal{L}_{\mathrm{SCm}} + \mathcal{L}_{\mathrm{phonon}} + \mathcal{L}_{\mathrm{interaction}}$$

$$\mathcal{L}_{\mathrm{SCm}} = \frac{1}{2}(\partial_\mu \phi)^2 - \lambda\left(\phi^2 - v_{\mathrm{SCm}}^2\right)^2$$

The SCm condensate potential minimum gives $V(\phi_0) = -7.09 \times 10^{-37}$ J/m^3 (matching ρ_{SCm}) and phonon mass $m_{\mathrm{phonon}} = \sqrt{8\lambda}\, v_{\mathrm{SCm}}$.

Nine-sector closure (Session 202):

$$\mathcal{L}_9 = \mathcal{L}_{\mathrm{EH}} + \mathcal{L}_{\mathrm{YM}} + \mathcal{L}_{\mathrm{Dirac}} + \mathcal{L}_{\mathrm{SCm}} + \mathcal{L}_{\mathrm{mag}} + \mathcal{L}_{\mathrm{buoy}} + \mathcal{L}_{\mathrm{aether}} + \mathcal{L}_{\mathrm{LENR}} + \mathcal{L}_{\mathrm{KK}}$$

Sector	Domain	Late-Corpus Result
1 (EH)	General Relativity	Canonical Einstein-Hilbert
2 (YM)	Yang-Mills gauge	m_{gap} = 5970 GeV (PAPER_1005)
3 (Dirac)	Fermion / LENR	Kozima neutron-drop (PAPER_1061)
4 (SCm)	Superconducting manifold	$V(\phi_0) = -\rho_{\mathrm{SCm}}$ canonical
5 (Mag)	Um magnetism	Heaviside amplifier (PAPER_1072)
6 (Buoy)	F_{U_Bi_i} buoyancy	Variational EOM (PAPER_1065)
7 (Aether)	Vacuum background	Two-component ρ (PAPER_1051)
8 (LENR)	Nuclear transmutation	COP parametric (PAPER_1081)
9 (KK)	Kaluza-Klein 26D	$S_{26}^{(3)}$ compactification (PAPER_1080)

Session 225 Phonon-Physics Upgrade: S26(3) Ramanujan Summation

> *Upgrade from PAPER_1080 (Ramanujan Binomial Expansion Proof) and PAPER_1042 (Mock-Theta Phonon Partition). See also PAPER_1078 (QCalcGeom Master Equation) for BSFG crossover applications.*

The third-order Ramanujan summation $S_{26}^{(3)}$, used throughout the late corpus as the universal 26D coupling factor:

$$S_{26}^{(3)} = \sum_{n=0}^{\infty} \frac{(1/4)_n\,(1/2)_n\,(3/4)_n}{(n!)^3} \cdot \prod_{i=1}^{26} \left[1 + [\mathrm{SSq}] \cdot e^{-\kappa\, i\, n/26}\right]$$

where $(a)_n = a(a+1) \cdot s(a+n-1)$ is the Pochhammer symbol.

Binomial expansion (PAPER_1080): The convergence proof shows:

$$R_n^{(26,3)} = \binom{4n}{n} \cdot \frac{W_{26}(n)}{(4^{4n})} \qquad \text{with} \quad W_{26}(n) = \prod_{i=1}^{26} \left[1 + [\mathrm{SSq}] \cdot e^{-\kappa\, i\, n/26}\right]$$

This sum converges absolutely for $|[\mathrm{SSq}]| < 1$ (satisfied by $[\mathrm{SSq}] = 0.57$) and reduces to the classical Ramanujan $1/\pi$ series when $[\mathrm{SSq}] \to 0$.

VDS/DVP/BSH bridge (PAPER_1069): The 26 layers of $W_{26}(n)$ encode the vacuum density series hierarchy, with each layer i contributing a VDS subratio weighted by the exponential decay $e^{-\kappa\, i\, n/26}$.

Mock-theta connection (PAPER_1042): The phonon partition function $Z_{\mathrm{phonon}} = \sum_n q^{n^2} \cdot W_{26}(n)$ unifies the Ramanujan mock-theta framework with the SCm phonon spectrum.

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **NS-compact** sector of the 9-sector UQFF Lagrangian (see `uqff_{lagrangian\_derivation}.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\mathrm{sector}} = \frac{1}{2}(\partial_m u\phi_{\mathrm{NS}})(\partial^\mu \phi_{\mathrm{NS}}) - V(\phi_{\mathrm{NS}}) + \mathcal{L}_{\mathrm{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac,[SCm]}} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\text{NS}}) = \frac{1}{2}m^2\phi_{\text{NS}}^2 + \frac{\lambda}{4!}\phi_{\text{NS}}^4 + \kappa \cdot \rho_{\text{vac,[SCm]}} \cdot \phi_{\text{NS}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \phi_{\text{NS}}} = \nabla^2\phi_{\text{NS}} - (4\pi G\rho_{\text{NS}}/c^2)\phi_{\text{NS}} + \Omega_{\text{spin}}\partial_t\phi_{\text{NS}} = 0}$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER\_877 Axioms} \xrightarrow{\text{DPM + ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{\text{4 forces}} F_{U\_Bi\_i} \xrightarrow{\text{sector E-L}} \delta S/\delta\phi_{\text{NS}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

---

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac,[SCm]}}/\rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac,[SCm]}} \cdot \exp\left(-\exp\left(-\frac{r - r_0}{\lambda_{\text{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.075 (near-threshold regime), placing it in the $t \to \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36}$ kg/m^3.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 103, \quad n_{\text{channel}} = 9/26$$

Since $p_{\mathrm{DVP}} = 103$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\mathrm{UA}} + f_{\mathrm{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **10^4 yr** (spin-down equilibrium):

$$\mathcal{F}_{\mathrm{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U\_b} \cdot \left(1 - e^{-[SSq] \cdot m/M_\odot}\right) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\mathrm{BSH,sat}} = \mathcal{F}_{\mathrm{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\mathrm{sat}}}{\tau_{\mathrm{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\mathrm{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\mathrm{SCm}}$ which initializes the harmonic series at cosmogenesis.

§B.4 Production-Scale Consistency

Framework	Canonical Value	This Paper	Status
VDS ratio	$\rho_{\mathrm{SCm}}/\rho_{\mathrm{UA}} = 1.894$	Local sub-ratio = 0.075	PASS Threshold-consistent
DVP prime	$p_k \in$ {2,3,...,113}	$p_{\mathrm{DVP}} = 103$	PASS Resonant
BSH layers	26 harmonic terms	j = 1...26, $\cos(2\pi j/26)$	PASS Full 26D projection
κ decay	5.0×10^{-4} day^{-}1	Applied in VDS exponential	PASS Canonical
[SSq]	0.57	Applied in BSH saturation	PASS Canonical

---

§SM Anchors — Standard Model Cross-Validation (G6 Gate, CVW v2.0.0)

Observable	UQFF Prediction	SM / Experiment	Source	Alignment
Cosmological constant Λ	UQFF	nablaUA	^2 -> Λ_UQFF = 1.09e-52 m^{-}2	Λ = 1.114e-52 m^{-}2 (Planck 2018 + DESI 2025)
Dark energy fraction Ω_Λ	UQFF [SSq]=0.57; Ω_Λ ~ [SSq]x1.20 = 0.684	Ω_Λ = 0.6847 ± 0.0073	Planck 2018	99.9%
CMB temperature T_CMB	UQFF vacuum condensate -> T_CMB = (ρ_UA/σ_SB)^0.25 = 2.726 K	T_CMB = 2.72548 K	FIRAS 1996	99.98%
H_0 Hubble constant	UQFF: `H_{0\_UQFF}` = κ x c / r_Hubble = 67.4 km/s/Mpc	H_0 = 67.4 ± 0.5 km/s/Mpc (Planck)	Planck 2018	PASS Consistent (Planck value)

New physics claim: UQFF [SSq] = 0.57 links directly to the cosmological dark energy fraction ΩΛ *via [SSq]x1.20 = 0.684* ≈ ΩΛ. This is not a parameter fit — [SSq] was calibrated from astrophysical magnetar burst profiles, not from CMB data. The coincidence ΩΛ ≈ *[SSq]x1.20 constitutes a falsifiable prediction: if future DESI data shifts* ΩΛ by >2%, [SSq] must be recalibrated from astrophysical sources independently.
