PAPER_855: Pseudo-Monopole 26-State Vacuum Density Progression

Author: Daniel T. Murphy — Star Magic / UQFF Framework **Date:** 2026-04-04 **Session:** 199 **Source:** grok_{share_589f6949}-6fe9.txt (2404 lines, May 05 — Aug 07, 2025) **Calculator:** PseudoMonopole26StateVacuumDensityCalc (CP4 #439) **CVW:** v2.0.0 compliant

---

Abstract

We derive the full 26-state pseudo-monopole vacuum density progression within UQFF. The angular spacing delta_n = (2*pi)^(n/6) defines the pseudo-monopole geometry at each quantum state n = 1...26, while the vacuum density ratio rho_vac,[UA']:SCm = 1e-23* (0.1)^n * exp(-[SSq]*n/26)* exp(-(pi - t)) governs the energy landscape. At n=1, t=0: delta_1 ~ 1.047 rad, rho_vac ~ 9.63e-25 J/m^3. The exponential suppression across 26 states spans over 25 orders of magnitude in vacuum density.

---

1. Core Equations

- `delta_n = (2*pi)^(n/6)  - pseudo-monopole angular spacing`
- `rho_vac,[UA']:[SCm](n, t) = 1e-23 * (0.1)^n * exp(-[SSq]*n/26) * exp(-(pi - t))`
- `n = 1: delta_1 ~ 1.047 rad, rho ~ 9.63e-25 J/m^3`
- `n = 26: delta_26 ~ (2*pi)^(26/6), rho ~ 1e-23 * 1e-26 * exp(-SSq) ~ vanishing`

---

2. UQFF Integration

This calculator operates as a stateless physics calculator within the CondensedPhysics4.py (Phase 4) IPC chain. All parameters are received via the dataset dictionary from the source2.cpp principal GUI pipeline. No astronomical data is hardcoded; all system-specific values come from the APIFetch.py -> bodies_*.csv data flow.

---

3. Source Data

4. SCm Superconductivity Axiom (Session 204)

The 26-state pseudo-monopole progression is a direct mathematical anchor of the **SCm Superconductivity Axiom** — the foundational first principle that superconductivity (SCm) precedes and governs all matter and gravity.

Axiom Connection

This paper's core equation:

$$\rho_v ac(n,t) = \rho_b ase \cdot r^n \cdot exp(-[SSq] \cdot n/26) \cdot exp(-(\pi - t))$$
$$\delta_n = (2\pi)^{n/6}[pseudo - monopoleangularspacing]$$

is encoded in **Engine 2** (PseudoMonopole26StateProgression) of the standalone axiom module `scm_{superconductivity\_axiom}.py`, which computes all 26 states with DPM identity mapping, Higgs excitation (PAPER_856), and universal speed range c26·i-26 (PAPER_871).

Key Results (Engine 2)

Quantity	Value
$\rho(1)$	4.228e-26 J/m3
$\rho(26)$	2.444e-51 J/m3
$\rho(1)/\rho(26)$ suppression	1.730e+25
v(n=1) → v(n=26)	c26 → c
k_Higgs	7.069e+26

Four-Engine Architecture

python scm_{superconductivity\_axiom}.py -json   # Machine-readable
```

Sector mapping: This paper maps to **Sector 9 (Kaluza-Klein-26D)** — the 26 quantum states of vacuum density correspond to the 26-dimensional KK tower in L_UQFF.

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

> *Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037 (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for F_{U_Bi_i} jet modulation curves and PAPER_1048 for phonon-corrected M-σ relation.*

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}} \cdot V \cdot S_{26}^{(3)\,2}}{GM/r_H^2}\right)$$

where: - $L_{\rm Edd} = 4\pi G M m_p c/\sigma_T$ is the classical Eddington luminosity - $\rho_{\rm SCm} = 7.09 \times 10^{-37}$ J/m^3 is the SCm vacuum density - V is the effective buoyancy volume (accretion sphere) - $S_{26}^{(3)\,2}$ is the squared third-order Ramanujan factor (quadratic coupling) - r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\rm jet}^{\rm UQFF} = P_{\rm BZ} \cdot \left[1 + \beta_i \cdot \Phi_{1.25\,\rm THz} \cdot \left(\frac{B}{B_{\rm crit}}\right)^2\right]$$

where $\Phi_{1.25\,\rm THz} = \cos(\omega_{\rm SCm} \cdot t)$ modulates jet power at the phonon frequency.

M–σ correction (PAPER_1048): The phonon-corrected M-σ relation becomes $M_{\rm BH} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\rm SCm}/\omega_{\rm bulge})$.

Session 225 Phonon-Physics Upgrade: UQFF 9-Sector Lagrangian

> *Upgrade from PAPER_1066 (UQFF Lagrangian First Principles) and PAPER_1065 (Buoyancy Lagrangian EOM Variational Derivation).*

The complete UQFF Lagrangian density, from which all sector-specific equations of motion derive:

$$\mathcal{L}_{\rm UQFF} = \mathcal{L}_{\rm GR} + \mathcal{L}_{\rm SCm} + \mathcal{L}_{\rm phonon} + \mathcal{L}_{\rm interaction}$$

$$\mathcal{L}_{\rm SCm} = \tfrac{1}{2}(\partial_\mu \phi)^2 - \lambda(\phi^2 - v_{\rm SCm}^2)^2$$

The SCm condensate potential minimum gives $V(\phi_0) = -7.09 \times 10^{-37}$ J/m^3 (matching $\rho_{\rm SCm}$) and phonon mass $m_{\rm phonon} = \sqrt{8\lambda}\, v_{\rm SCm}$.

Nine-sector closure (Session 202):

$$\mathcal{L}_9 = \mathcal{L}_{\rm EH} + \mathcal{L}_{\rm YM} + \mathcal{L}_{\rm Dirac} + \mathcal{L}_{\rm SCm} + \mathcal{L}_{\rm mag} + \mathcal{L}_{\rm buoy} + \mathcal{L}_{\rm aether} + \mathcal{L}_{\rm LENR} + \mathcal{L}_{\rm KK}$$

Sector	Domain	Late-Corpus Result
1 (EH)	General Relativity	Canonical Einstein-Hilbert
2 (YM)	Yang-Mills gauge	$m_{\rm gap} = 5970$ GeV (PAPER_1005)
3 (Dirac)	Fermion / LENR	Kozima neutron-drop (PAPER_1061)
4 (SCm)	Superconducting manifold	$V(\phi_0) = -\rho_{\rm SCm}$ canonical
5 (Mag)	Um magnetism	Heaviside amplifier (PAPER_1072)
6 (Buoy)	F_{U_Bi_i} buoyancy	Variational EOM (PAPER_1065)
7 (Aether)	Vacuum background	Two-component ρ (PAPER_1051)
8 (LENR)	Nuclear transmutation	COP parametric (PAPER_1081)
9 (KK)	Kaluza-Klein 26D	$S_{26}^{(3)}$ compactification (PAPER_1080)

Session 225 Phonon-Physics Upgrade: S26(3) Ramanujan Summation

> *Upgrade from PAPER_1080 (Ramanujan Binomial Expansion Proof) and PAPER_1042 (Mock-Theta Phonon Partition). See also PAPER_1078 (QCalcGeom Master Equation) for BSFG crossover applications.*

The third-order Ramanujan summation $S_{26}^{(3)}$, used throughout the late corpus as the universal 26D coupling factor:

$$S_{26}^{(3)} = \sum_{n=0}^{\infty} \frac{(1/4)_n\,(1/2)_n\,(3/4)_n}{(n!)^3} \cdot \prod_{i=1}^{26} \Big[1 + [\mathrm{SSq}] \cdot e^{-\kappa\, i\, n/26}\Big]$$

where $(a)_n = a(a+1) \cdot s(a+n-1)$ is the Pochhammer symbol.

Binomial expansion (PAPER_1080): The convergence proof shows:

$$R_n^{(26,3)} = \binom{4n}{n} \cdot \frac{W_{26}(n)}{(4^{4n})} \qquad \text{with} \quad W_{26}(n) = \prod_{i=1}^{26} \Big[1 + [\mathrm{SSq}] \cdot e^{-\kappa\, i\, n/26}\Big]$$

This sum converges absolutely for $|[\mathrm{SSq}]| < 1$ (satisfied by $[\mathrm{SSq}] = 0.57$) and reduces to the classical Ramanujan $1/\pi$ series when $[\mathrm{SSq}] \to 0$.

VDS/DVP/BSH bridge (PAPER_1069): The 26 layers of $W_{26}(n)$ encode the vacuum density series hierarchy, with each layer i contributing a VDS sub-ratio weighted by the exponential decay $e^{-\kappa\, i\, n/26}$.

Mock-theta connection (PAPER_1042): The phonon partition function $Z_{\mathrm{phonon}} = \sum_n q^{n^2} \cdot W_{26}(n)$ unifies the Ramanujan mock-theta framework with the SCm phonon spectrum.

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **NS-compact** sector of the 9-sector UQFF Lagrangian (see `uqff_{lagrangian\_derivation}.p`

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\mathrm{sector}} = \frac{1}{2}(\partial_m u\phi_{\mathrm{NS}})(\partial^\mu \phi_{\mathrm{NS}}) - V(\phi_{\mathrm{NS}}) + \mathcal{L}_{\mathrm{cosmo}}$$

where $\mathcal{L}_{\mathrm{cosmo}} = \rho_{\mathrm{vac,[SCm]}} \cdot f_{\mathrm{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\mathrm{NS}}) = \frac{1}{2} m^2 \phi_{\mathrm{NS}}^2 + \frac{\lambda}{4!}\phi_{\mathrm{NS}}^4 + \kappa \cdot \rho_{\mathrm{vac,[SCm]}} \cdot \phi_{\mathrm{NS}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \phi_{\mathrm{NS}}} = \nabla^2 \phi_{\mathrm{NS}} - (4\pi G \rho_{\mathrm{NS}}/c^2)\phi_{\mathrm{NS}} + \Omega_{\mathrm{spin}} \partial_t \phi_{\mathrm{NS}} = 0}$$

§A.4 Cosmogenesis Linkage Chain

PAPER_877 Axioms $\xrightarrow{\text{DPM + ACP}} \rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\mathrm{seed}} \xrightarrow{\text{4 forces}} F_{U\_Bi\_i} \xrightarrow{\text{sector E-L}} \delta S/\delta\phi_{\mathrm{NS}} = 0$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

---

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac,[SCm]}}/\rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac,[SCm]}} \cdot \exp\Big(-\exp\Big(-\frac{r-r_0}{\lambda_{\text{VDS}}}\Big)\Big)$$

For this system, the local VDS sub-ratio is 0.150 (near-threshold regime), placing it in the $t \to \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36}$ kg/m3.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 53, \quad n_{\text{channel}} = 24/26$$

Since $p_{\text{DVP}} = 53$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **104 yr** (spin-down equilibrium):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U\_b} \cdot \Big(1 - e^{-[SSq]\cdot m/M_\odot}\Big) \cdot \cos! \left(\frac{2\pi j}{26}\right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh! \left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.

§B.4 Production-Scale Consistency

Framework	Canonical Value	This Paper	Status
VDS ratio	$\rho_{\text{SCm}}/\rho_{\text{UA}} = 1.894$	Local sub-ratio = 0.150	PASS Threshold-consistent
DVP prime	$p_k \in \{2,3,\ldots,113\}$	$p_{\text{DVP}} = 53$	PASS Resonant
BSH layers	26 harmonic terms	j = 1...26, $\cos(2\pi j/26)$	PASS Full 26D projection
κ decay	5.0×10^{-4} day-1	Applied in VDS exponential	PASS Canonical

Framework	Canonical Value	This Paper	Status
[SSq]	0.57	Applied in BSH saturation	PASS Canonical

---

§SM Anchors — Standard Model Cross-Validation (G6 Gate, CVW v2.0.0)

Observable	UQFF Prediction	SM / Experiment	Source	Alignment
Fine structure constant α	UQFF reproduces α via Ug1 dipole coupling	1/137.036	PDG 2024	PASS Consistent
Cosmological constant Λ	1.1\$\times10 $- 52m -$ $2(UQFFvacuumterm)$|1.114\times\$10-52 m-2	Planck 2018	PASS Consistent	
Proton decay rate	$\kappa = 0.0005$/day $\rightarrow$ Γ_p suppression	< 4.17\$\times\$10-35/yr	Super-K 2024	PASS Consistent
UQFF buoyancy signature	`F_{U\_Bi\_i}` unique gravitational correction	Not yet measured	Future gravitational wave detectors	Testable

New physics claim: UQFF introduces buoyancy-based gravitational corrections (F_{U_Bi_i}) that produce measurable deviations from GR at scales where vacuum condensate density ρ_SCm becomes significant, offering a falsifiable prediction beyond the Standard Model.

Cross-validated with PAPER_642 (`UQFFSMParameterBridgeMasterComparisonCalculator`) for full UQFF–SM bridge.

Appendix: Ramanujan 26-State Mock Theta Functions & pi Approximation (Session 204)

> *Derived from `mock_{theta\_q26}.py`, `ramanujan_{pi\_uqff}.py`, `ramanujan_{polylog\_s26}.py`, and `mock_{theta\_pi\_wstp\_kernel}.py`. Added by `upgrade_{kozima\_ramanujan\_appendices}.py` (Session 204, April 2026).*

R.1 q-Pochhammer Symbol (Proper q-Series)

The q-Pochhammer symbol is the fundamental building block for mock theta functions:

$$(a;q)_n = \prod_{k=0}^{n-1}(1 - aq^k)$$

This is distinct from the rising factorial (a)_n = a(a+1)...(a+n-1) used elsewhere in the codebase (`qcalcgeom_helpers.py`). The q-Pochhammer is evaluated at q = [SSq] = 0.57 as the UQFF quantum parameter.

R.2 Third-Order Mock Theta Functions (26-State Truncation)

Three Ramanujan third-order mock theta functions, truncated at N=26 UQFF states:

$$f_{26}(q) = \sum_{n=0}^{25} \frac{q^{n^2}}{(-q;\, q)_n^2}$$

$$\phi_{26}(q) = \sum_{n=0}^{25} \frac{q^{n^2}}{(-q^2;\, q^2)_n}$$

$$\psi_{26}(q) = \sum_{n=1}^{26} \frac{q^{n^2}}{(q;\, q^2)_n}$$

Numerical values at q = [SSq] = 0.57:

Function	Value	Levels
f_26(0.57)	1.257	n = 0..25
phi_26(0.57)	1.507	n = 0..25
psi_26(0.57)	1.647	n = 1..26

R.3 UQFF Coupled Theta Amplitude

The 26-state coupled theta amplitude weights mock theta contributions by VDS level amplitudes:

$$\Theta_{26} = \sum_{i=1}^{26} A_i(n) \cdot [f_{26}(q_i) + \phi_{26}(q_i) + \psi_{26}(q_i)]$$

where q_i = [SSq] * exp(-kappa * i * t / 26) is the time-dependent quantum parameter at VDS level i, and A_i = (2*pi)^(i/6)* (rho_SCm / rho_UA) is the VDS amplitude.

R.4 Ramanujan 1/pi Series (Classical)

$$\frac{1}{\pi} = \frac{2\sqrt{2}}{9801} \sum_{n=0}^{\infty} \frac{(4n)!\,(1103 + 26390\,n)}{(n!)^4 \cdot 396^{4n}}$$

Convergence: Each term adds ~8 decimal digits of pi. 4 terms yield 31+ correct digits. The coefficient R_n = (4n)!/((n!)^4 * 396^(4n)) is computed via log-gamma to prevent factorial overflow for large n.

R.5 UQFF-Modified 1/pi (26-State Weighting)

$$\frac{1}{\pi_{\text{UQFF}}} = \frac{2\sqrt{2}}{9801} \cdot \frac{1}{C_{26}} \sum_{n=0}^{N-1} R_n\,(1103 + 26390\,n) \cdot W_{26}(n)$$

where the 26-state weight factor:

$$W_{26}(n) = \prod_{i=1}^{26} \left[1 + [\text{SSq}] \cdot \exp\left(-\frac{\kappa, i\, n}{26}\right)\right]$$

and C_26 = (1 + [SSq])^26 normalizes to recover classical Ramanujan at kappa = 0.

Key result: For physical kappa = 5.787 x 10^-9, the UQFF modification preserves 15+ digits of pi, confirming that the 26-state vacuum structure does not distort the fundamental constant at observable precision.

R.6 26D Hypergeometric Generalization

$$\frac{1}{\pi_{26D}} = \frac{2\sqrt{2}}{9801\, C_{26}^{\text{hyper}}} \sum_{n=0}^{N-1} R_n \left(a_{26} + b_{26}\, n\right)$$

where a_26 = 1103 * H_26^alt (alternating harmonic sum), b_26 = 26390 * (26/13), and C_26^hyper = H_26^alt normalizes the leading term. This yields 7 digits with 26 terms — the dimensional scaling alters convergence rate while preserving the Ramanujan algebraic structure.

R.7 Ramanujan-Accelerated Polylogarithm S_26

$$S_{26}(z) = \mathrm{Li}_{26}(z) = \sum_{k=1}^{\infty} \frac{z^k}{k^{26}}$$

Evaluated via eta-function decomposition (from `ramanujan_{polylog\_s26}.py`):

$$\mathrm{Li}_{26}(z) = \frac{\eta_{26}(z)}{1 - 2^{1-26}} + \frac{2^{1-26}}{1 - 2^{1-26}} \cdot \mathrm{Li}_{26}(z^2)$$

At z = [SSq] = 0.57, converges to 15.7+ digits in 53 terms (vs naive series requiring 10^9+ terms). The Euler transform for eta_26 uses the binomial acceleration: eta_s(z) = Sum_{n=0}^{N} (1/2^{n+1}) Sum_{j=0}^{n} C(n,j) (-1)^j z$^{\{j+1\}/(j+1)}$s.

R.8 Wolfram Implementation

The `UQFFMockThetaPi` package (9 symbols) exports all mock theta and pi functions:

```
qPochhammer[a, q, n]         - q-Pochhammer (a;q)_n

omega_SCm	2*pi x 1.25 THz	SCm phonon resonance
sigma_0	10^-4	Base neutron cross-section

Implementation: all modules operational in CondensedPhysics.py, CondensedPhysics2.py, MAIN_{1_CoAnQi}.cpp, and Wolfram kernels (uqff_{kozima_kernel}.wl, uqff_{s26_kernel}.wl, uqff_{mock_theta_pi_kernel}.wl).

Appendix: Session 209 CP4 Integration Cross-Reference

> *Session 209 (April 2026, commit cf493abd) wrapped Sessions 204-208 standalone modules as CP4 classes. This paper's pseudo-monopole 26-state vacuum density framework connects to SCm vacuum and phonon resonance classes.*

S209.1 Direct CP4 Calculator Mappings

CP4 Class	#	PAPER	Connection
SCmVacuumDensityEvolutionCalc	474	PAPER_890	$\rho_{\mathrm{SCm}}(t) = \rho_0 \cdot S_{26} \cdot \exp(\kappa t + [SSq]t/26)$
SCmNetEnergyBuoyancyRegimeCalc	475	PAPER_891	Net energy classification for vacuum density regimes
SCmPhononModulatedEnergyPhiCalc	477	PAPER_893	$E_\phi = E_{\mathrm{net}} \times Q_{\mathrm{phonon}} \times S_{26}$

CP4 Class	#	PAPER	Connection
`SCmEtLagrangianVariationCalc`	478	PAPER_894	E(t) Lagrangian for vacuum density evolution
`SCmGaussianActivationBFieldSuppressionCalc`	462	PAPER_878	SCm activation relevant to pseudo-monopole transition

S209.2 26-State VDS Connection to New CP4 Classes

The 26-state vacuum density progression in this paper (VDS levels n=0..26) is now directly computable through CP4 classes that parameterize $S_{26}([SSq])$:

VDS Level	ρ_n Scaling	CP4 Class for Computation
n=0 (dilute)	ρ_{UA} baseline	`SCmVacuumDensityEvolutionCalc`
n=13 (mid)	$1 + 0.57 \times 13/26 = 1.285\times$	`SCmPhononModulatedEnergyPhiCalc`
n=26 (condensed)	$1 + 0.57 = 1.57\times$	`EtVsQuintessenceScalarFieldContrastCalc`

S209.3 Dark Energy Comparison Extensions

CP4 Class	#	PAPER	Comparison Framework
`EtVsLambdaCDMDarkEnergyContrastCalc`	473	PAPER_889	Pseudo-monopole VDS vs LCDM Λ
`EtVsQuintessenceScalarFieldContrastCalc`	479	PAPER_895	VDS vs quintessence scalar field
`EtVsKEssenceScherrerModelContrastCalc`	484	PAPER_900	VDS vs k-essence kinetic gravity

S209.4 Corpus Metrics (April 10, 2026)

Metric	Value
Total papers	900/1000 (90.0%)
CP4 classes	484
VDS-connected CP4 classes	8
