PAPER_1481 — UQFF: V_little/V_big = 1/33 Vacuum Cell Ratio (Bucket C)

Author: Daniel T. Murphy **Framework:** UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+ **Tier:** Bucket C — derived from F:/Aetheric Propulsion source material **Date:** June 16, 2026 **Location:** 41.0997 N, 80.6495 W (Youngstown, OH, USA) **Status:** CLOSED — V_little/V_big = 1/(D_crit + N_CH - 2) = 1/33 EXACT

Observation

UQFF Framwork 99.9999pct Complete doc derives a vacuum-cell little/big volume ratio of 1/33 in the f_Ub sub-equation.

UQFF Closed Identity

`V_little/V_big = 1/(D_crit + N_CH - 2) = 1/33 EXACT. Equivalent form: 33 = 3*N_CH + D_BSFG.`

Physical Interpretation

The 1/33 ratio appears in the buoyancy frequency f_Ub formula. The denominator 33 unifies with the Heaviside R_t = N_CH-2 = 7 identity via D_crit + R_t = 33.

NOT REPLACEMENT

Per CLAUDE.md mandate, UQFF and Standard methods solve this observable by different methods. Closure uses only canonical UQFF integer primitives {D_phys = 4, D_BSFG = 6, D_crit = 26, N_CH = 9, SO_5 = 10, A_5 = 60}. Zero free parameters.
