Abstract

This paper presents a UQFF analysis of Ubi: 4-Term Solar Wind Buoyancy Decomposition with ε_sw, deriving compressed field equations and observational predictions within the Star-Magic/UQFF framework.

1. Overview

PAPER_394 defined the buoyancy force U_{bi} applied to a single Ugi term. PAPER_403 extracts the **complete 4-term Ubi decomposition** from the construction file:

$$U_{bi} = U_{bi,1} + U_{bi,2} + U_{bi,3} + U_{bi,4}$$

where each term applies the buoyancy formula independently to U_{g1}, U_{g2}, U_{g3}, U_{g4}.

The novel addition is the **solar wind buoyancy modulation** $(1 + \varepsilon_{sw} \cdot \rho_{sw})$, a first-principles coupling between solar wind plasma density and UQFF buoyancy response.

2. Formula

2.1 Individual Ubi Term

$$\boxed{U_{bi,k} = -\beta_i \cdot U_{g,k} \cdot \Omega_g \cdot \frac{M_{bh}}{d_g} \cdot (1 + \varepsilon_{sw} \cdot \rho_{sw}) \cdot U_{UA} \cdot \cos(\pi t_n)}$$

where $k = 1, 2, 3, 4$ and $U_{g,k}$ is the corresponding U_{g1}, U_{g2}, U_{g3}, U_{g4}.

2.2 Total Buoyancy

$$U_{bi,\text{total}} = \sum_{k=1}^{4} U_{bi,k} = -\beta_i \cdot \Omega_g \cdot \frac{M_{bh}}{d_g} \cdot (1+\varepsilon_{sw} \cdot \rho_{sw}) \cdot U_{UA} \cdot \cos(\pi t_n) \cdot \left(U_{g1} + U_{g2} + U_{g3} + U_{g4}\right)$$

4. Novel Physics

4.1 Solar Wind Buoyancy Modulation (1 + ε_sw · ρ_sw)

The modulation factor:

$$1 + \varepsilon_{sw} \cdot \rho_{sw} = 1 + (10^{-3})(8 \times 10^{-21}) = 1 + 8 \times 10^{-24} \approx 1.000000000000000000000008$$

At standard solar wind conditions, this is near-unity (0.8 parts in 10^{23} amplification). However, during **solar energetic particle events** and **coronal mass ejections**, ρ_{sw} can increase by 6-8 orders: $\rho_{sw,\mathrm{CME}} \sim 10^{-13}$ kg/m^3.

At CME density: $1 + \varepsilon_{sw} \cdot \rho_{sw,\mathrm{CME}} = 1 + 10^{-16}$ — still small but potentially measurable in precision Ubi experiments.

4.2 4-Term Ubi Architecture

Prior formulations used a single U_{bi} applied to the total U_g. The construction file reveals that **each Ugi component generates its own buoyancy response independently**:

$$U_{bi,k} \propto U_{g,k}$$

This creates a buoyancy **cascade**: large U_{g2} (from E_react amplification) generates the dominant buoyancy contribution, while U_{g4} (scale-invariant at 4.219×10^{-10} m/s^2) generates a universal background buoyancy.

4.3 Comparison: Sum vs Previous Single-Term

With the 4-term sum, total U_{bi} at Sun:

$$U_{bi,\mathrm{total}} \approx -\beta_i \cdot \Omega_g \cdot \frac{M_{bh}}{d_g} \cdot 1.0 \cdot U_{UA} \cdot (U_{g1} + U_{g2} + U_{g3} + U_{g4})$$

The dominant term will be $U_{bi,2}$ (from U_{g2}) due to E_react amplification. $U_{bi,4}$ provides the universal solar-wind-modulated vacuum background.

---

5. Solar Wind Density Scaling

Condition	ρ_{sw} (kg/m^3)	$(1 + \varepsilon_{sw} \cdot \rho_{sw})$
Calm solar wind (1 AU)	8×10^{-21}	$1 + 8 \times 10^{-24}$
Active solar wind	8×10^{-20}	$1 + 8 \times 10^{-23}$
Solar storm (CME)	$\sim 10^{-17}$	$1 + 10^{-20}$
Solar minimum (outer helio)	$\sim 10^{-23}$	$1 + 10^{-26}$

The ε_{sw} term provides UQFF **solar weather sensitivity** — a direct modulation of galactic-scale buoyancy by local solar wind conditions.
