Magnetar Magnetic Energy and Outburst Timescale: M_mag = 2.01\times1037 J and \tau = 12.7 yr

Daniel T. Murphy

PAPER_365 — Magnetar Magnetic Energy and Outburst Timescale: M_mag = 2.01$\times$1037 J and τ = 12.7 yr **Date:** 2025

Whitepaper Series: Star-Magic UQFF Phase 2
Session: 97
Source: gok_{share_31b5c807a4}.txt (Supplemental Gap Analysis Block)
Classification: FIRST UQFF derivation of magnetar outburst timescale τ_outburst from M_mag/L_X ratio
Author: Daniel T. Murphy

<!— UQFF constants: κ = 5.0e-4 day-1, [SSq] = 0.57, M_UQFF = 1.43e1 TeV —>

Abstract

The total magnetic energy reservoir of a canonical magnetar (B = 2$\times$1010 T, SGR class) is computed as
M_mag = B2V/(2μ0) = 2.01$\times$1037 J. This reservoir drains at the persistent X-ray luminosity L_X,
giving an outburst timescale τ_outburst = M_mag/L_X $\approx$ 12.7 yr. The spin-down rate is ν■ =
-f_react/(2πP), connecting observed spin-down to the UQFF vacuum reactance frequency. These three values (M_mag, τ_outburst, ν■) form the canonical magnetar energy budget in UQFF.

---

2. Core Physics

2.1 Magnetic Energy Reservoir

$$M_{\mathrm{mag}} = \frac{B^2 V}{2\mu_0}$$

For B = 2$\times$1010 T and magnetospheric volume V ~ μ0 c3/B2 $\times$ (spin-down constraint):
$$M_{\mathrm{mag}} = 2.01 \times 10^{37}\ \mathrm{J}$$

This is approximately 3 solar masses equivalent in energy (cf. E_sun,rest = 1.8$\times$1047 J — M_mag is
~10-10 $\times$ rest mass energy).

2.2 Outburst Timescale

$$\tau_{\mathrm{outburst}} = \frac{M_{\mathrm{mag}}}{L_X}$$

For persistent magnetar L_X ~ 5$\times$1028 W = 5$\times$1035 erg/s:
$$\tau_{\mathrm{outburst}} = \frac{2.01\times 10^{37}\ \mathrm{J}}{5\times 10^{28}\ \mathrm{W}} =

4.02\times 10^8\ \mathrm{s} \approx 12.7\ \mathrm{yr}$$

2.3 Spin-Down Rate

$$\dot{\nu} = -\frac{f_{\mathrm{react}}}{2\pi P}$$

where:
- P = 3.76 s (rotation period)
- f_react = UQFF vacuum reactance frequency

$$\dot{\nu} = -\frac{f_{\mathrm{react}}}{2\pi \times 3.76} = -\frac{f_{\mathrm{react}}}{23.63}\ \mathrm{Hz/s}$$

2.4 Energy Budget Summary

Energy Storage	Value
M_mag (magnetic)	2.01$\times$1037 J
τ_outburst (drain time)	12.7 yr
L_X (persistent)	~5$\times$1028 W
ν■ (spin-down)	-f_react/(2πP)

---

3. Key Values

Quantity	Formula	Value
B	SGR class	2$\times$1010 T
M_mag	B2V/(2μ0)	2.01$\times$1037 J
L_X	X-ray persistent	~5$\times$1028 W
τ_outburst	M_mag/L_X	12.7 yr
P	Rotation period	3.76 s
ν■	-f_react/(2πP)	-f_react/23.63 Hz/s

---

4. Physical Significance

The τ_outburst = 12.7 yr timescale derived from M_mag/L_X provides a definitive UQFF prediction for
how long a magnetar can sustain its observed X-ray luminosity from the magnetic energy reservoir alone. For SGR 1745-2900 (active since June 2013), the τ_outburst = 12.7 yr predicts the X-ray flux should have declined to ~1/e of its peak by June 2026. This is directly testable with Chandra/NICER monitoring campaigns.

This paper also explicitly connects τ_outburst = 12.7 yr to the Centaurus A activation period (PAPER_347, 12.5 yr), suggesting a universal ~12–13 year magnetospheric energy timescale scale present in both stellar and AGN compact objects.

---

5. Deduplication Note

- **vs. PAPER_342 (Magnetar DPM-THz):** PAPER_342 derives the frequency form; PAPER_365 derives the energy budget and τ_outburst.
- **vs. PAPER_343 (SGR1745):** PAPER_343 derives L_X = ρ_vac$\cdot$f_res$\cdot$V; PAPER_365 uses L_X to derive τ_outburst = M_mag/L_X.

---

6. Classification

Physics Territory: FIRST UQFF magnetar outburst timescale derivation from M_mag/L_X
Scale: Stellar (magnetar; ~10 km radius)

Session 225 Phonon-Physics Upgrade: GW Strain Modulation

> *Upgrade from PAPER_1000 (NS Merger Phonon Suppression) and PAPER_1022*
> *(GW Phonon Strain SCm Modulation). See also PAPER_1011-1012 for*
> *GW170817/GW190425 upgraded analyses.*

The late-corpus phonon analysis (Sessions 219-225) reveals that the SCm vacuum field modulates gravitational-wave strain via a frequency-dependent suppression factor. The corrected strain amplitude is:

$$h_{\text{UQFF}}(\Gamma) = h_{\text{GR}} \cdot \left(1 - 0.47\,\frac{\Phi(\Gamma)}{S_{26}^{(3)}}\right)$$

where:
- $\Phi(\Gamma) = \cos(\omega_{\text{SCm}} \cdot t) \cdot \Theta(H_{\text{SCm}} - 0.5)$ is the phonon modulation factor
- $\omega_{\text{SCm}} = 2\pi \times 1.25\;\text{THz}$ is the SCm phonon resonance frequency
- $S_{26}^{(3)} = \sum_{n=0}^{\infty} \frac{(1/4)_n\,(1/2)_n\,(3/4)_n}{(n!)^3} \cdot \prod_{i=1}^{26}\left[1 + [\text{SSq}]\cdot e^{-\kappa\,i\,n/26}\right]$ is the third-order Ramanujan summation
- Θ is the Heaviside step ensuring $H_{\text{SCm}} \geq 0.5$ (phase-transition threshold)

Physical mechanism: The 1.25 THz phonon field of the SCm vacuum creates a standing-wave pattern that partially decouples the metric perturbation from the radiation zone, producing a 47% peak strain reduction for optimally oriented NS mergers. The BCS gap energy ΔE_{BCS} of the neutron-star crust couples to this phonon field, creating a mass-gap classifier that distinguishes NS from BH remnants at $M \approx 2.5\,M_\odot$.

Calibration (canonical): $\kappa = 5 \times 10^{-4}\;\text{day}^{-1}$, $[\text{SSq}] = 0.57$, $\beta_i = 0.603$, $H_{\text{SCm}} \approx 0.99$.

<!-- PKG-AGN-S225 -->

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

> *Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037*
> *(AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for F_U_Bi_i jet*

> *modulation curves and PAPER_1048 for phonon-corrected M-σ relation.*

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}} \cdot V \cdot S_{26}^{(3)\,2}}{G M / r_H^2}\right)$$

where:
- $L_{\text{Edd}} = 4\pi G M m_p c / \sigma_T$ is the classical Eddington luminosity
- $\rho_{\text{SCm}} = 7.09 \times 10^{-37}\;\text{J/m}^3$ is the SCm vacuum density
- V is the effective buoyancy volume (accretion sphere)
- $S_{26}^{(3)\,2}$ is the squared third-order Ramanujan factor (quadratic coupling)
- r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:
$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25\,\text{THz}} \cdot \left(\frac{B}{B_{\text{crit}}}\right)^2\right]$$

where $\Phi_{1.25\,\text{THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M–σ correction (PAPER_1048): The phonon-corrected M-σ relation becomes $M_{\text{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}}/\omega_{\text{bulge}})$.

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **magnetar-field** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\mathrm{sector}} = \frac{1}{2}(\partial_\mu \phi_B)(\partial^\mu \phi_B) - V(\phi_B) + \mathcal{L}_{\mathrm{cosmo}}$$

where $\mathcal{L}_{\mathrm{cosmo}} = \rho_{\mathrm{vac,[SCm]}} \cdot f_{\mathrm{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_B) = \frac{1}{2} m^2 \phi_B^2 + \frac{\lambda}{4!} \phi_B^4 + \kappa \cdot \rho_{\mathrm{vac,[SCm]}} \cdot \phi_B$$

§A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \phi_B} = \nabla \times (\rho_{\mathrm{SCm}} \mathbf{v} \times \mathbf{B}) + \kappa B_{\mathrm{crit}} \partial_t \phi_B = 0}$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER\_877 Axioms} \xrightarrow{\text{DPM + ACP}} \rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\mathrm{seed}} \xrightarrow{\text{4 forces}} F_U_Bi_i \xrightarrow{\text{sector E-L}} \delta S/\delta \phi_B = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

---

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\mathrm{vac,[SCm]}} / \rho_{\mathrm{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\mathrm{vac}}(r) = \rho_{\mathrm{vac,[SCm]}} \cdot \exp\!\left(-\exp\!\left(-\frac{r - r_0}{\lambda_{\mathrm{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.185 (near-threshold regime), placing it in the $t \to \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} = 7.799 \times 10^{-36}$ kg/m3.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\mathrm{DVP}} = 13, \quad n_{\mathrm{channel}} = 2/26$$

Since $p_{\mathrm{DVP}} = 13$ is **sub-threshold** (threshold at $p > 26$), the system's vacuum topology inherits sub-threshold damping from the DVP lattice, producing smooth rather than resonant UQFF coupling profiles. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair $(f_{\mathrm{UA}}' + f_{\mathrm{SCm}} = 1)$ constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **103 yr** (field decay quiescence):

$$\mathcal{F}_{\mathrm{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_U_b \cdot \left(1 - e^{-[SSq] \cdot m/M_\odot}\right) \cdot \cos\!\left(\frac{2\pi j}{26}\right)$$

The $\tanh$ saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\mathrm{BSH,sat}} = \mathcal{F}_{\mathrm{BSH}} \cdot \left(1 - \tanh\!\left(\frac{t - t_{\mathrm{sat}}}{\tau_{\mathrm{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\mathrm{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\mathrm{SCm}}$ which initializes the harmonic series at cosmogenesis.

§B.4 Production-Scale Consistency

Framework	Canonical Value	This Paper	Status
VDS ratio	$\rho_{\mathrm{SCm}}/\rho_{\mathrm{UA}} = 1.894$	Local sub-ratio = 0.185	PASS Threshold-consistent
DVP prime	$p_k \in$ {2,3,...,113}	$p_{\mathrm{DVP}} = 13$	PASS Sub-threshold
BSH layers	26 harmonic terms	j = 1...26, $\cos(2\pi j/26)$	PASS Full 26D projection
κ decay	5.0×10^{-4} day-1	Applied in VDS exponential	PASS Canonical
[SSq]	0.57	Applied in BSH saturation	PASS Canonical
