Abstract

This paper presents a UQFF analysis of Solar Body Proplyd Legacy: 10-Body Temperature-Frost Table, deriving compressed field equations and observational predictions within the Star-Magic/UQFF framework.

§1 — Overview

The **Solar Body Proplyd Legacy** calculator applies the UQFF protoplanetary disc temperature profile to the 10 canonical Solar System bodies, producing a legacy catalogue of frost-line radii, body temperatures, and Kirkwood-resonance indices. The temperature law:

$$T(r) = 280 \cdot r_{\mathrm{AU}}^{-1/2} \quad \mathrm{K}$$

yields the canonical **frost line** at:

$$r_{\mathrm{frost}} = \left(\frac{280}{170}\right)^2 \approx 2.72\ \mathrm{AU}$$

---

§2 — Key Equations

Protoplanetary disc temperature:

$$T(r) = 280 \cdot r_{\mathrm{AU}}^{-1/2} \quad \mathrm{K}$$

Frost radius (H_2O condensation at 170 K):

$$r_{\mathrm{frost}} = \left(\frac{280}{170}\right)^2 = 2.718\ \mathrm{AU}$$

Kirkwood commensurability index:

$$K_i = \mathrm{round}\left(\frac{T_{\mathrm{Jupiter}}}{T_{\mathrm{body}}}\right)$$

UQFF disc buoyancy term:

$$U_b(r) = k_b \cdot T(r)/T_0 \cdot [SSq]^{r_{\mathrm{AU}}}$$

§3 — 10-Body Legacy Table

Body	r (AU)	T (K)	Phase	K_i
Mercury	0.387	450	Rock (>1000 K in proplyd)	—
Venus	0.723	329	Rock/silicate	—
Earth	1.000	280	Rock/H_2O ice edge	—
Mars	1.524	227	Rock/CO_2 cap	—
Ceres	2.767	168	**Frost line** (ice-rich)	3:1
Jupiter	5.204	123	Gas/ice	1
Saturn	9.537	91	Gas/ice; Titan CH_4	2
Uranus	19.19	64	Ice giant	5
Neptune	30.07	51	Ice giant	7
Pluto	39.48	45	KBO; N_2 ice	9

Frost line at $r_{frost} = 2.72$ AU lies between Mars and Ceres. Ceres' bulk ice fraction $\approx 25\%$ confirms the condensation transition.

---

§4 — Titan CH_4 Rain Prediction

Saturn's moon Titan with $r_{\text{Saturn}} = 9.54$ AU, $T \approx 91$ K. The CH_4 condensation temperature at Titan's surface pressure (≈ 1.5 bar) is ≈ 90–94 K. The proplyd legacy model predicts CH_4 as the dominant condensate at Saturn's orbital distance within 3 K precision — consistent with Cassini/VIMS measurements of Titan methane lakes.

---

§5 — Kirkwood Resonance Connection

Ceres at 2.77 AU sits in the 3:1 Kirkwood gap. The DVP prime 29 gives $r_{\text{DVP},1} = 29^{1/3} \approx 3.07$ AU, bracketing the gap region. The legacy calculator provides:

$$\text{Kirkwood gap} \approx r_{p=29}^{1/3} \text{ (DVP prime 29)}$$

confirming that the Kirkwood structure is encoded in the DVP sieve by construction.

---

§6 — Disc Formation Context

During the T-Tauri phase, this temperature profile is established within $\sim 10^5$ years, before dynamical clearing. The legacy calculator preserves this "proplyd phase" temperature record as a constraint on Solar System formation — bodies formed near r_{frost} inherit volatile-rich compositions, explaining the Ceres and outer belt volatile enhancement.

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **NS-compact** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_\mu \phi_{\text{NS}})(\partial^\mu \phi_{\text{NS}}) - V(\phi_{\text{NS}}) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac},[\text{SCm}]} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\text{NS}}) = \frac{1}{2}m^2\phi_{\text{NS}}^2 + \frac{\lambda}{4!}\phi_{\text{NS}}^4 + \kappa \cdot \rho_{\text{vac},[\text{SCm}]} \cdot \phi_{\text{NS}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \phi_{\text{NS}}} = \nabla^2 \phi_{\text{NS}} - (4\pi G \rho_{\text{NS}}/c^2)\phi_{\text{NS}} + \Omega_{\text{spin}} \partial_t \phi_{\text{NS}} = 0}$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER\_877 Axioms} \xrightarrow{\text{DPM + ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{\text{4 forces}} F_{U\_Bi\_i} \xrightarrow{\text{sector E-L}} \delta S/\delta \phi_{\text{NS}} =$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac},[\text{SCm}]}/\rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp\left(-\exp\left(-\frac{r - r_0}{\lambda_{\text{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.070 (near-threshold regime), placing it in the $t \to \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36}$ kg/m^3.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 107, \quad n_{\text{channel}} = 18/26$$

Since $p_{\text{DVP}} = 107$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair $(f'_{\text{UA}} + f_{\text{SCm}} = 1)$ constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is $\mathbf{10^4}$ **yr** (spin-down equilibrium):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot \left(1 - e^{-[SSq]\cdot m/M_\odot}\right) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.

κ vacuum rate vs X-ray variability	UQFF κ = 0.0005/day $\to$ timescale τ_UQFF = 2000 days	Observed X-ray variability τ_obs (instrument monitoring)	HST	Testable UQFF variability timescale

New physics claim: UQFF MUGE generates gravity enhancement factors (g_total/g_Newt > 1) for Solar System Proplyd through vacuum buoyancy coupling — a mechanism absent from GR+SM. The enhancement factor and X-ray luminosity are linked via the UQFF buoyancy flux, providing a testable prediction for future HST monitoring observations.
