Abstract

The Arkani-Hamed-Dimopoulos-Dvali (ADD) large extra dimensions model (arXiv:1607.01831) is extended within UQFF via the F_LED term. With n=2 extra dimensions and M* = 1 TeV, F_LED = 6.72e-23 N — negligible against F_LENR (6.17e37 N) but conceptually significant at negative-buoyancy SMBH sites. The graviton leakage hypothesis proposes that extra-dimensional drainage amplifies vacuum reversal at Sgr A*, connecting submillimeter gravity tests (R ~ 0.2 mm compactification radius) to astrophysical negative buoyancy.

---

1. ADD Model Framework

```
ADD (1998): gravity propagates in (4+n) dimensions
SM fields confined to 3+1 brane

Fundamental scale: M* ~ 1 TeV (accessible to LHC)
Planck scale: M_Pl = 1.22e19 GeV (apparent 4D weakness of gravity)

Relationship: M_Pl^2 ~ M*^(n+2) * R^n
For n=2: R ~ (M_Pl/M*)^(2/2) / M* * hbar_c
        = (1.22e19 / 10^3)^1 / 10^3 * 1.973e-16
        ~ 2.41e-4 m ~ 0.24 mm
```

---

2. F_LED Term

```
F_LED = k_LED * (M* / M_Pl)^2
      = 10^10 * (10^3 / 1.22e19)^2
      = 10^10 * 6.72e-34
      = 6.72e-24 N

Comparison:
  F_LED      = 6.72e-24 N
  F_LENR     = 6.17e37 N
  F_LED/F_LENR = 1.09e-61
```

---

3. Compactification Radius

```
R_n ~ (M_Pl / M*)^(2/n) * hbar_c / M*

n=1: R ~ 2.41e13 m  (too large, ruled out by solar system)
n=2: R ~ 1.96e-4 m  (0.2 mm — submillimeter gravity test range)
n=3: R ~ 6.8e-12 m  (atomic scale)
n=4: R ~ 1.6e-15 m  (nuclear scale)
n=6: R ~ 1.1e-19 m  (electroweak scale)

n=2 is the phenomenologically interesting case:
submillimeter gravity tests (Eot-Wash, IUPUI) constrain R < ~37 um
for n=2, pushing M* > 3.6 TeV.
```

---

4. Graviton Leakage at Sgr A*

```
Hypothesis:
At Sgr A* (negative buoyancy, F_U_Bi ~ -8.31e211 N),
graviton leakage into n=2 extra dimensions may amplify
the vacuum reversal mechanism.

F_U_Bi(Sgr A*, with F_LED) = F_U_Bi(base) + F_LED
= -8.31e211 + 6.72e-24
~ -8.31e211 N (F_LED negligible numerically)

But: the ADD framework provides a theoretical mechanism
for WHY negative buoyancy occurs at SMBH scales:
graviton drainage reduces effective 4D gravitational coupling
at short distances, while UQFF's F_0 scale reversal amplifies
the effect at astrophysical scales.
```

---

5. 8-System Recalculation with F_LED

All 8 sonification systems recalculated with F_LED integrated:

```
F_LED = 6.72e-24 N (constant across all systems)

Impact: <10^-60 fractional change in F_U_Bi for all systems
Physically interesting but numerically negligible.
```

Conclusion

F_LED connects UQFF to the ADD extra-dimensional framework at 6.72e-24 N. While numerically negligible, the graviton leakage hypothesis at Sgr A* provides a theoretical bridge between submillimeter gravity experiments and astrophysical negative buoyancy. The n=2 compactification radius of ~0.2 mm sits precisely in the range of current torsion balance experiments.

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **LENR-nuclear** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.p`

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u\chi)(\partial^\mu \chi) - V(\chi) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac},[\text{SCm}]} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\chi) = \frac{1}{2}m^2\chi^2 + \frac{\lambda}{4!}\chi^4 + \kappa \cdot \rho_{\text{vac},[\text{SCm}]} \cdot \chi$$

§A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \chi} = \ddot{\chi} + \omega_{\text{LENR}}^2 \chi - \lambda \cos(\omega_{\text{act}} t) - \sigma_n(\omega)\chi = 0}$$

§A.4 Cosmogenesis Linkage Chain

PAPER_877 Axioms $\xrightarrow{\text{DPM + ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{\text{4 forces}} F_{U\_Bi\_i} \xrightarrow{\text{sector E-L}} \delta S/\delta\chi = 0$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac,[SCm]}}/\rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac,[SCm]}} \cdot \text{exp!} \left(-\text{exp!} \left(-\frac{r - r_0}{\lambda_{\text{VDS}}} \right) \right)$$

For this system, the local VDS sub-ratio is 0.153 (near-threshold regime), placing it in the $t \to \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36}$ kg/m3.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 31, \quad n_{\text{channel}} = 19/26$$

Since $p_{\text{DVP}} = 31$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 protonuclear shell formation: the DPM proportion pair $(f'_{\text{UA}} + f_{\text{SCm}} = 1)$ constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **10-12 s** (nuclear phonon damping):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U\_b} \cdot \left(1 - e^{-[SSq] \cdot m/M_\odot}\right) \cdot \text{cos!} \left(\frac{2\pi j}{26} \right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \text{tanh!} \left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}} \right) \right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.
