Abstract

The Multi-System UQFF Core Compression Framework establishes the architectural template for UQFF Compression Cycle 2, defining the shared methodology by which an arbitrary number of astrophysical systems can be simultaneously calculated under a single compressed gravitational equation. The unified architecture uses modular environmental factor (`F_env`) summation with Hubble evolution `H(t,z)`, standard map-based dynamic variable storage, and consistent UQFF/MUGE term parameterisation across all Cycle 2 systems. The seven canonical systems (MagnetarSGR1745, SagittariusA, TapestryStarbirth, Westerlund2, PillarsCreation, RingsRelativity, UniverseGuide) define the baseline registry from which the 19- and 29-system expansions are derived.

2. Core Architecture — PAPER_448

2.1 Compression Cycle 2 Philosophy

In UQFF Compression Cycle 1 (Sessions 1–114), each astrophysical system maintained a dedicated class with hardcoded parameters. Compression Cycle 2 introduces a **generalised modular registry** in which:

1. System parameters are stored in `std::map<std::string, double>` containers
2. Environmental factors `F_env` are computed as a unified sum across all system-specific terms
3. A single compressed `g_UQFF(t)` equation applies to any registered system
4. Dynamic parameter updates propagate automatically through the registry

2.2 Unified Gravitational Equation (Core)

$$g_{\mathrm{UQFF}}(r,t) = \frac{GM(t)}{r^2}(1 + H_z t)(1 - B/B_{\mathrm{crit}}) + \sum_i U_{gi} + \frac{\Lambda c^2}{3} + g_{\mathrm{quantum}} + g_{\mathrm{fluid}} + F_{\mathrm{env}}(t)$$

Where the total environmental modifier:

$$F_{\text{env}}(t) = \sum_{j=1}^{N_{\text{sys}}} F_{\text{env}}^{(j)}(t, \{p_j\})$$

With $\{p_j\}$ = system-specific parameter map for system j.

2.3 Hubble Evolution Module

$$H(t, z) = H_0 \sqrt{\Omega_m (1+z)^3 + \Omega_L ambda}$$

Evaluated at z for each system: - Local (z$\approx$0): H ≈ 70 km/s/Mpc - Intermediate (z=0.5): H ≈ 85 km/s/Mpc
- Cosmological (z=1100, CMB): H ≈ 70×√(0.3$\times$11003+0.7) km/s/Mpc

$$H_z = H(z)/H_0 \text{ [dimensionless Hubble factor]}$$

2.4 Dynamic Variable Storage (FIRST in UQFF)

The C++ implementation introduces `std::map<std::string, double>` as the canonical storage for per-system variables:

$$\begin{aligned}
&params["M"] = system_mass[kg]\\
&params["r"] = radius[m]\\
&params["z"] = redshift[dimensionless]\\
&params["B"] = magnetic_field[T]\\
&params["v_exp"] = expansion_vel[m/s]\\
&params["rho"] = fluid_density[kg/m3]\\
&params["F_env"] = env_modifier[m/s2]\\
&params["SC_m"] = superconductive[dimensionless]
\end{aligned}$$

This is the **first use of runtime-keyed variable maps** for per-system UQFF gravity in the codebase — replacing class-member variables with O(log n) lookup tables allowing unlimited parameter extension without recompilation.

2.5 Canonical 7-System Registry

System	type_key	key parameters
MagnetarSGR1745	MAGNETAR_SGR1745	M=2.8 MM_sun, r=1e4 m, B=1e11 T
SagittariusA	SAGITTARIUS_A	M=4.1e6 MM_sun, r=6e9 m, B=1e-3 T
TapestryStarbirth	TAPESTRY_STARBIRTH	M=500 MM_sun, r=1e16 m, z=0.001
Westerlund2	WESTERLUND2	M=1e4 MM_sun, r=6e16 m, z=0.005
PillarsCreation	PILLARS_CREATION	M=200 MM_sun, r=6e16 m, z=0.002
RingsRelativity	RINGS_RELATIVITY	M=1e39 kg, r=1e20 m, z=0.3
UniverseGuide	UNIVERSE_GUIDE	M=1e53 kg, r=4.4e26 m, z=1100

These 7 are the Compression Cycle 2 **root systems** — all subsequent 19- and 29-system registries add to this base.

3. Ug Component Summary

3.1 Ug1 — Magnetic Dipole Term

$$U_{g1} = -\frac{\mu_0 m_1 m_2}{4\pi r^3}\left(1 - \frac{r_s}{r}\right)$$

3.2 Ug2 — Charge Reactivity Term

$$U_{g2} = k_e \frac{q_1 q_2}{r}\left(1 + \frac{\kappa t}{\tau_q}\right)$$

3.3 Ug3 — String Rotation Term (UQFF-specific)

$$U_{g3} = \frac{GM_{\text{ext}}}{r_{\text{ext}}^2}\left(1 + \frac{v_s}{c}\cos\theta\right)$$

Compressed form (Cycle 2):

$$U'_{g3} = \frac{GM_{\text{ext}}}{r_{\text{ext}}^2}$$

3.4 Ug4 — Vacuum Concentration Term

$$U_{g4} = U_A \rho_{\text{vac}} \left(1 + [\text{UA}] \cdot [\text{SCm}]\right)$$

---

4. Quantum and Fluid UQFF Terms

4.1 Quantum Gravity Coupling

$$g_{\text{quantum}} = \frac{\hbar c}{l_p^2}\frac{t}{t_p} \cdot \frac{1}{Mc^2}$$

Where $l_p = \sqrt{\hbar G/c^3} = 1.616 \times 10^{-35}$ m (Planck length), $t_p = l_p/c$.

4.2 Fluid Navier-Stokes Coupling

$$g_{\text{fluid}} = \nu_{\text{fluid}} \nabla^2 v + (\mathbf{v} \cdot \nabla)\mathbf{v}$$

Simplified for radial symmetry:

$$g_{\text{fluid}} \approx \rho_{\text{fluid}} v_{\text{exp}}^2 / r$$

---

5. Ψ_total Integration

The full quantum-gravitational wave function total combines UQFF modes:

$$\psi_{\text{total}} = \int_0^\infty A(k) e^{i(kr - \omega t)} dk + \frac{[SSq]^{n_{26}}}{[SSq]^{n_{26}-1}}$$

The discrete multi-system version sums over all N registered systems:

$$\psi_{\text{total}}^{(N)} = \sum_{j=1}^{N} g_{\text{UQFF}}^{(j)}(r, t) \cdot w_j$$

Where w_j = system weight (default: equal weights = 1/N).

---

6. Standard Model Comparison

Feature	SM	CC2 (UQFF)
Per-system gravity	Individual Poisson eq.	Unified compressed registry
Environmental coupling	External perturbation	Built-in F_env term
Dynamic parameter storage	Compile-time	Runtime std::map
Multi-system simultaneity	Separate solvers	Single g_UQFF call for N systems

---

7. Testable Predictions

1. **Runtime extensibility:** Adding a new astrophysical system to the Cycle 2 registry should require zero recompilation — only map insertion. Testable by adding any new entry and verifying output.
2. **F_env additivity:** For two weakly-interacting systems (e.g., Tapestry + Pillars at large separation), F_{env_total} ≈ F_{env_1} + F_{env_2} within 0.1%.
3. **Hubble evolution consistency:** H(z=0.5) from the modular H(t,z) function should reproduce H0$\sqrt{}$(0.3\$\times1.53 + 0.7) = $H0$\times0.894 = 62.6$km/s/Mpc$(\pm\$1%).

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

> *Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037 (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for F_{U_Bi_i} jet modulation curves and PAPER_1048 for phonon-corrected M-σ relation.*

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}} \cdot V \cdot S_{26}^{(3)\,2}}{GM/r_H^2}\right)$$

where: - $L_{\text{Edd}} = 4\pi GMm_p c/\sigma_T$ is the classical Eddington luminosity - $\rho_{\text{SCm}} = 7.09 \times 10^{-37}$ J/m^3 is the SCm vacuum density - V is the effective buoyancy volume (accretion sphere) - $S_{26}^{(3)\,2}$ is the squared third-order Ramanujan factor (quadratic coupling) - r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25\,\text{THz}} \cdot \left(\frac{B}{B_{\text{crit}}}\right)^2\right]$$

where $\Phi_{1.25\,\text{THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M–σ correction (PAPER_1048): The phonon-corrected M-σ relation becomes $M_{\text{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}}/\omega_{\text{bulge}})$.

Session 225 Phonon-Physics Upgrade: UQFF 9-Sector Lagrangian

> *Upgrade from PAPER_1066 (UQFF Lagrangian First Principles) and PAPER_1065 (Buoyancy Lagrangian EOM Variational Derivation).*

The complete UQFF Lagrangian density, from which all sector-specific equations of motion derive:

$$\mathcal{L}_{\text{UQFF}} = \mathcal{L}_{\text{GR}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{phonon}} + \mathcal{L}_{\text{interaction}}$$

$$\mathcal{L}_{\text{SCm}} = \tfrac{1}{2}(\partial_\mu \phi)^2 - \lambda(\phi^2 - v_{\text{SCm}}^2)^2$$

The SCm condensate potential minimum gives $V(\phi_0) = -7.09 \times 10^{-37}$ J/m^3 (matching ρ_{SCm}) and phonon mass $m_{\text{phonon}} = \sqrt{8\lambda}\, v_{\text{SCm}}$.

Nine-sector closure (Session 202):

$$\mathcal{L}_9 = \mathcal{L}_{\text{EH}} + \mathcal{L}_{\text{YM}} + \mathcal{L}_{\text{Dirac}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{mag}} + \mathcal{L}_{\text{buoy}} + \mathcal{L}_{\text{aether}} + \mathcal{L}_{\text{LENR}} + \mathcal{L}_{\text{KK}}$$

Sector	Domain	Late-Corpus Result
1 (EH)	General Relativity	Canonical Einstein-Hilbert
2 (YM)	Yang-Mills gauge	$m_{\text{gap}} = 5970$ GeV (PAPER_1005)
3 (Dirac)	Fermion / LENR	Kozima neutron-drop (PAPER_1061)

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **magnetar-field** sector of the 9-sector UQFF Lagrangian (see `uqff_{lagrangian\_derivation}`

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u \phi_B)(\partial^\mu \phi_B) - V(\phi_B) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac,[SCm]}} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_B) = \frac{1}{2} m^2 \phi_B^2 + \frac{\lambda}{4!}\phi_B^4 + \kappa \cdot \rho_{\text{vac,[SCm]}} \cdot \phi_B$$

§A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \phi_B} = \nabla \times (\rho_{\text{SCm}} \mathbf{v} \times \mathbf{B}) + \kappa B_{\text{crit}} \partial_t \phi_B = 0}$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER\_877 Axioms} \xrightarrow{\text{DPM + ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{\text{4 forces}} F_{U\_Bi\_i} \xrightarrow{\text{sector E-L}} \delta S/\delta\phi_B = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

---

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac,[SCm]}}/\rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac,[SCm]}} \cdot \exp\Big(-\exp\Big(-\frac{r - r_0}{\lambda_{\text{VDS}}}\Big)\Big)$$

For this system, the local VDS sub-ratio is 0.054 (near-threshold regime), placing it in the $t \to \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36}$ kg/m3.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 109, \quad n_{\text{channel}} = 7/26$$

Since $p_{\text{DVP}} = 109$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **103 yr** (field decay quiescence):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U\_b} \cdot \Big(1 - e^{-[SSq]\cdot m/M_\odot}\Big) \cdot \cos!\left(\frac{2\pi j}{26}\right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh!\left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.

New physics claim: UQFF MUGE generates gravity enhancement factors (g_total/g_Newt > 1) for Astrophysical system through vacuum buoyancy coupling — a mechanism absent from GR+SM. The enhancement factor and X-ray luminosity are linked via the UQFF buoyancy flux, providing a testable prediction for future Chandra CXC monitoring observations.
