PAPER_880: Positive E(t) Buoyancy Expansion Master

Author: Daniel T. Murphy – Star Magic / UQFF Framework **Date:** 2026-04-08 **Session:** 209 **Source:** Sessions 204-208 standalone module integration **Calculator:** PositiveEtBuoyancyExpansionMasterCalc (CP4 #464) **CVW:** v2.0.0 compliant

---

Abstract

Master equation for positive E(t) buoyancy-driven cosmic expansion. $E^{+}(t) = E_0 \cdot \exp(\kappa t + [SSq] \cdot t/26) \cdot S_{26}([SSq]) \cdot (F_{U,Bi}/F_U)$ with Ramanujan 26-state mock theta acceleration. $S_{26} = \Sigma_{n=1}^{26} \exp(-[SSq] \cdot n/26)$ provides the quantum state factor. Applies to nebulae, star-forming regions, and cosmogenesis expansion regimes.

---

1. Core Equations

$$E^{+}(t) = E_0 \cdot \exp(\kappa t + [SSq] \cdot t/26) \cdot S_{26} \cdot (F_{U,Bi}/F_U)$$
$$S_{26} = \Sigma \exp(-[SSq] \cdot n/26)$$

---

2. Parameters

Parameter	Default	Description
E_0	1.0 J	Initial energy scale
t	0.0 s	Time parameter
F_UBi_over_FU	1.1	Buoyancy-to-field ratio

---

3. UQFF Integration

This calculator integrates positive_et_expansion.py from Session 205 into the CP4 pipeline as class #464.
