PAPER_958: Production Scaling v10 Benchmark (450k calc/s)

Author: Daniel T. Murphy — Star Magic / UQFF Framework
Date: 2026-04-12
Session: 214
Source: production_scaling_v10.py (ProductionScalingV10)
Calculator: ProductionScalingV10BenchmarkCalc (CP4 #542)
CVW: v2.0.0 compliant

Abstract

We benchmark the UQFF production pipeline at 450,000 calculations per second, a 12.5% improvement over the v9 baseline of 400,000. Two new kernels — BCS gap solve and spectral ladder evaluation — are added to the existing 12, bringing the total to 14 simultaneously benchmarked kernels.

---

1. Scaling History

Version	Target (calc/s)	Kernels	Session
v4	100,000	4	198
v5	150,000	6	200
v6	200,000	8	204
v7	300,000	10	208
v8	350,000	11	210
v9	400,000	12	213
v10	**450,000**	**14**	**214**

2. New Kernels (v10)

kernel_bcs_gap_solve BCS gap fixed-point iteration at $T = 4.2$ K: $$\Delta_{n+1} = \frac{\hbar\omega_\text{SCm}}{2} \tanh\!\left(\frac{\Delta_n}{2k_BT}\right) \cdot S_{26} \cdot \frac{F_{UBi}}{F_U}$$

kernel_spectral_ladder_eval 26-state HRes spectral ladder: $$E_n = E_0 \cdot (2\pi)^{n/3} \cdot S_{26}, \quad n = 1, \ldots, 26$$

3. Benchmark Architecture

All 14 kernels execute in a hot loop. Throughput is measured as:
$$\text{rate} = \frac{N_\text{iter} \times 14}{t_\text{elapsed}}$$

Target: $\text{rate} \geq 450{,}000$ calc/s.

Session 225 Phonon-Physics Upgrade: S26(3) Ramanujan Summation

> *Upgrade from PAPER_1080 (Ramanujan Binomial Expansion Proof) and*
> *PAPER_1042 (Mock-Theta Phonon Partition). See also PAPER_1078*
> *(QCalcGeom Master Equation) for BSFG crossover applications.*

The third-order Ramanujan summation $S_{26}^{(3)}$, used throughout the late corpus as the universal 26D coupling factor:

$$S_{26}^{(3)} = \sum_{n=0}^{\infty} \frac{(1/4)_n\,(1/2)_n\,(3/4)_n}{(n!)^3} \cdot \prod_{i=1}^{26}\left[1 + [\text{SSq}]\cdot e^{-\kappa\,i\,n/26}\right]$$

where $(a)_n = a(a+1)\cdot s(a+n-1)$ is the Pochhammer symbol.

Binomial expansion (PAPER_1080): The convergence proof shows:
$$R_n^{(26,3)} = \binom{4n}{n} \cdot \frac{W_{26}(n)}{(4^{4n})} \qquad \text{with}\quad W_{26}(n) = \prod_{i=1}^{26}\left[1 + [\text{SSq}]\cdot e^{-\kappa\,i\,n/26}\right]$$

This sum converges absolutely for $|[\text{SSq}]| < 1$ (satisfied by $[\text{SSq}] = 0.57$) and reduces to the classical Ramanujan $1/\pi$ series when $[\text{SSq}] \to 0$.

VDS/DVP/BSH bridge (PAPER_1069): The 26 layers of $W_{26}(n)$ encode the vacuum density series hierarchy, with each layer i contributing a VDS sub-ratio weighted by the exponential decay $e^{-\kappa\,i\,n/26}$.

Mock-theta connection (PAPER_1042): The phonon partition function $Z_{\text{phonon}} = \sum_n q^{n^2} \cdot W_{26}(n)$ unifies the Ramanujan mock-theta framework with the SCm phonon spectrum.
