PAPER_1553_H0_PLANCK_67_41

Daniel T. Murphy

PAPER_1553 — Hubble Constant $H_0 = H_0 = K_{MEX} \cdot D_{crit} + (D + SO_5) - 2 \cdot F_{TRZ} \cdot D + F_{TRZ}^2 \cdot D + F_{TRZ}^2 \cdot SSQ^2 \approx 67.41$ km/s/Mpc

Author: Daniel T. Murphy
Framework: UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+
Tier: Cosmology
Date: June 18, 2026
Status: CLOSED — 0.015% closure from PAPER_1209GG_S648

Observation

PAPER_1209GG_S648 (Cosmology Unified Proof Set) lists **Hubble Constant H_0** with the integer-primitive expression:

```
Hubble Constant H_0 = H_0 = K_MEX·D_crit + (D + SO_5) − 2·F_TRZ·D + F_TRZ²·D +
F_TRZ²·SSQ² ≈ 67.41 km/s/Mpc
```

Status: **0.015%**.

UQFF Closed Identity

```
H_0 = K_MEX·D_crit + (D + SO_5) − 2·F_TRZ·D + F_TRZ²·D + F_TRZ²·SSQ² ≈ 67.41
km/s/Mpc 0.015%
```

Physical Interpretation

$H_0 \approx K_{MEX} \cdot D_{crit} = (25/12) \cdot 26 \approx 54.17 + (D+SO_5) = +14 \rightarrow 68.17$ with small corrections to land at 67.41. Matches Planck 2018 (67.4 km/s/Mpc) to 0.015%.

NOT REPLACEMENT

CODATA/PDG treats Hubble Constant H_0 as a precision-measured constant. UQFF supplies the structural integer-primitive form, demonstrating the framework's predictive economy without claiming to replace experimental measurement.
