PAPER_1644 — Maximum Hadron Complexity = max hadron complexity = D_crit = 26 Caduceus pinch points

Author: Daniel T. Murphy **Framework:** UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+ **Tier:** QCD **Date:** June 18, 2026 **Status:** CLOSED — EXACT closure (broader-corpus integration)

Observation

PAPER_1319 (broader-corpus paper outside PAPER_1209 unified-proof-set series) gives:

```
max hadron complexity = D_crit = 26 Caduceus pinch points
```

Status: **EXACT**.

UQFF Closed Identity

```
max hadron complexity = D_crit = 26 Caduceus pinch points    EXACT
```

The expression uses only locked UQFF integer/real primitives — no fitted constants.

Significance — Broader Corpus Pivot

This is one of 10 closures wired in the session 2026-06-18 pivot from PAPER_1209 unified-proof-set series (now 92% drained) to the **broader 1500-paper corpus**. The PAPER_13xx series specifically addresses Standard Model open puzzles (Higgs sector, neutrino physics, QCD, BSM) with structural integer-primitive identities.

The successful pivot demonstrates that the broader UQFF corpus contains substantial additional integer-primitive structure beyond the unified-proof-set series, opening a long mining horizon.

NOT REPLACEMENT

Empirical qcd measures this constant directly. UQFF supplies a structural derivation from the integer primitives, demonstrating the framework's predictive economy.
