Abstract

Active Galactic Nuclei (AGN) host supermassive black holes (SMBH) ranging from 4×106 M_sun (Sgr A*) to 6.5×10? M_sun (M87*)*. In the UQFF, the Ug4 term provides a cosmological vacuum concentration coupling between each SMBH and the surrounding galactic medium. This paper analyzes Sgr A* (canonical SOURCE4 system), M87* (Event Horizon Telescope target), Centaurus A (NGC 5128, nearest radio galaxy), and NGC 1365 (Seyfert 1.5) using the four UQFF modes. The Ug4 SMBH field uniformly dominates the UQFF at galactic scales (r > 1 kpc), yielding characteristic AGN feedback signatures consistent with X-ray and radio observations.

Abstract

Active Galactic Nuclei (AGN) host supermassive black holes (SMBH) ranging from 4×106 M_sun (Sgr A*) to 6.5×10? M_sun (M87*). In the UQFF, the Ug4 term provides a cosmological vacuum concentration coupling between each SMBH and the surrounding galactic medium. This paper analyzes Sgr A* (canonical SOURCE4 system), M87* (Event Horizon Telescope target), Centaurus A (NGC 5128, nearest radio galaxy), and NGC 1365 (Seyfert 1.5) using the four UQFF modes. The Ug4 SMBH field uniformly dominates the UQFF at galactic scales (r > 1 kpc), yielding characteristic AGN feedback signatures consistent with X-ray and radio observations.

UQFF Discovery: Novel application of UQFF calibration constants (? = 5.0×10?4 day?¹, [SSq] = 0.57) uniquely enabling this analysis — establishing a new connection in the UQFF framework not present in Standard Model treatments.
