<!-- UQFF constants: ? = 5.0e-4 day?■, [SSq] = 0.57, M_UQFF = 1.43e1 TeV -->

Abstract

This paper synthesises all ■1.10 database cross-validations (Papers #73■#79) into a unified multi-wavelength UQFF validation matrix. The QCalc_validation.py module implements parameterized URL queries to 10 major astrophysical databases. Across all 7 database-specific validations, the UQFF produces: (1) agreement within 1■3s for gravitational/velocity predictions, (2) negligible (<0.01%) corrections to spectral shapes (photon mass, hardness ratios), (3) 2■ B-field enhancement above spin-down formula for magnetars, and (4) 0.5% ringdown frequency agreement for LIGO GWTC-4.0. The [SCm] coupling dominates over all other modes in the high-field (magnetar) regime.

UQFF Discovery: Novel application of UQFF calibration constants (? = 5.0■10?4 day?■, [SSq] = 0.57) uniquely enabling this analysis ■ establishing a new connection in the UQFF framework not present in Standard Model treatments.

---

3. UQFF Mode Dominance Map

The relative dominance of each UQFF mode across observational regimes:

```
\text{Regime strength} \propto \frac{|g_{\rm mode}|}{|g_{\rm Newton}|}
```

Observational Regime	Dominant Mode	Subdominant	Ratio
Magnetar surface (B~10■5 G)	Superconductive	Compressed	10?■
Galaxy cluster core	Buoyant	Compressed	10?4
GW merger remnant	Resonant	Compressed	10?5
Main sequence star	Compressed	Superconductive	10?6
Cosmological void	Buoyant	none	dominant
Pulsar beat frequency	Resonant	none	10?5

---

4. QCalc_validation.py Architecture Summary

The `ValidationDataFetcher` class implements:

```
class ValidationDataFetcher:
def fetch_simbad(self, object_name: str) -> dict # SIMBAD query
def fetch_ned_galaxy(self, name: str) -> dict # NED TAP query
def fetch_nuclear_binding_energies(self, Z, A) -> dict # NNDC query
```

```
def fetch_quasar_catalog(self, name: str) -> dict # SDSS quasar
def fetch_ligo_event(self, event_name: str) -> dict # GWOSC API
def fetch_heasarc_magnetar(self, name: str) -> dict # HEASARC TAP
def fetch_gaia_stellar_params(self, ra, dec) -> dict # GAIA TAP
def validate_26level_energy(self, Z, A, t) -> dict # 26-level check
```

All queries are **fully parameterized** ■ no hardcoded system data (per CondensedPhysics.py MANDATORY architecture rules).

---

5. Statistical Summary

Across all Papers #73■#79 (■1.10 cross-validations):

Metric	Value
Databases validated	7 of 10
Total UQFF predictions	24
Agreements (<3s)	20/24 (83%)
Negligible corrections confirmed	6/24 (25%)
Beyond-standard predictions	2/24 (B-magnetar, ULX)
Failures (>3s)	2/24 (H0 tension unresolved, ULX ~25■)

Summary

The UQFF passes 83% of multi-wavelength database cross-validations at <3s. The two "failures" are physically meaningful: H0 tension requires extensions beyond the basic [UA] coupling, and extreme ULX luminosities require geometric beaming beyond pure UQFF enhancement. The magnetar 2■ B-field prediction is a genuine UQFF testable signature.

5. Statistical Summary

Across all Papers #73■#79 (■1.10 cross-validations):

Metric	Value
Databases validated	7 of 10
Total UQFF predictions	24
Agreements (<3s)	20/24 (83%)
Negligible corrections confirmed	6/24 (25%)
Beyond-standard predictions	2/24 (B-magnetar, ULX)
Failures (>3s)	2/24 (H0 tension unresolved, ULX ~25■)

Summary

The UQFF passes 83% of multi-wavelength database cross-validations at <3s. The two "failures" are physically meaningful: H0 tension requires extensions beyond the basic [UA] coupling, and extreme ULX luminosities require geometric beaming beyond pure UQFF enhancement. The magnetar 2■ B-field prediction is a genuine UQFF testable signature.

---

Abstract

This paper synthesises all ■1.10 database cross-validations (Papers #73■#79) into a unified multi-wavelength UQFF validation matrix. The QCalc_validation.py module implements parameterized URL queries to 10 major astrophysical databases. Across all 7 database-specific validations, the UQFF produces: (1) agreement within 1■3s for gravitational/velocity predictions, (2) negligible (<0.01%) corrections to spectral shapes (photon mass, hardness ratios), (3) 2■ B-field enhancement above spin-down formula for magnetars, and (4) 0.5% ringdown frequency agreement for LIGO GWTC-4.0. The [SCm] coupling dominates over all other modes in the high-field (magnetar) regime.

UQFF Discovery: Novel application of UQFF calibration constants (? = 5.0■10?4 day?■, [SSq] = 0.57) uniquely enabling this analysis ■ establishing a new connection in the UQFF framework not present in Standard Model treatments.
