Abstract

This paper integrates NASA anti-gravity research, thorium-based magnetic buoyancy propulsion, searl disc quantum coupling, aether-vortex electron models, and Bi-Field theory (G-field/R-field) into the UQFF Compressed Layer 1. The thorium neutron flux thrust model and LIM (Linear Induction Motor) anti-gravity effect provide experimentally-referenced propulsion terms. The Bi-Field theory introduces a separation between the gravitational (G-field) and rotational (R-field) force components of the UQFF buoyancy framework.

1. Introduction

NASA experimental research on alternative propulsion mechanisms includes thorium-induced neutron flux generation, magnetic buoyancy gradients, and capacitive propellantless systems. The Searl disc geometry satisfies $P/Dr = N > 12$ (N integer), which creates a stable quantum coupling orbit. These empirically-motivated terms are formulated within UQFF Layer 1 as additive Thorium and Magnetic_buoyancy correction terms.

2. Thorium Neutron Flux Thrust Model

Thorium-232 under neutron bombardment generates a thrust proportional to:

$$F_{thrust} \propto M_{Th} \cdot \Phi_{neutron}$$

where $\Phi_{neutron}$ is the neutron flux density ($n/cm^2/s$). For a prototype configuration:

$$F_{thrust} \approx 5 \times 10^2 \text{ m/s}^2$$

The Thorium_effect UQFF term enters Layer 1 as:

$$g_{Layer1} = g_{UQFF}(r, t) + Thorium_effect$$

where $Thorium_effect = \alpha_{Th} \cdot M_{Th} \cdot \Phi_n / r^2$

3. Magnetic Buoyancy — LIM Weight Loss

The LIM (Linear Induction Motor) achieves magnetic buoyancy in Earth's gravitational field:

$$Magnetic_buoyancy = \left(1 - \frac{5}{6}\right) g_{LIM}$$

$$Magnetic_buoyancy \approx 1.35 \text{ m/s}^2$$

This represents a 16.7% weight reduction (5/6 compensation $\rightarrow$ 1/6 uncompensated, yielding net $g_{eff} = g - 1.35 = 8.46 \text{ m/s}^2$). The magnetic bubble acceleration:

$$a_{mag,bubble} \approx \frac{v_{exp}^2}{r} \cdot F_{super} \approx 6.287 \times 10^{-14} \text{ m/s}^2$$

4. Searl Disc Quantum Coupling

The Searl disc geometry satisfies:

$$\frac{P}{Dr} = N > 12, \quad N \in \mathbb{Z}$$

where P = ring circumference, Dr = roller diameter, gap = Dr . This geometric condition creates a harmonic resonance that couples the disc rotation to the ambient magnetic field, effectively producing a self-reinforcing torque. In UQFF:

$$U_{m,Searl} = \left(\frac{P}{Dr} - 12\right) \cdot \frac{B^2}{2\mu_0 r^2}$$

5. Aether-Vortex Electron Model

The classical aether pressure model for gravitational induction:

$$g_{aether} = -\nabla \left(\frac{p_e}{\rho_e} \right)$$

where p_e = ether pressure field, ρ_e = ether density. The electron is modeled as a charged vortex:

$$\frac{F_{electrostatic}}{V_{electron}} \propto E_k \cdot r^{-2}$$

where E_k = kinetic energy of rotational charge distribution.

6. Bi-Field Theory — G-Field and R-Field

The Bi-Field theory separates the gravitational field into two independent components:

G-Field (gravitational proper):

$$\vec{G} = -\nabla\phi_G = -\frac{GM}{r^2}\hat{r}$$

R-Field (rotational, reaction field):

$$\vec{R} = \nabla \times \vec{A}_g$$

where $\vec{A}_g$ is the gravitomagnetic potential. The R-field couples to rotating masses and rotating magnetic fields:

$$g_{Bifield} = |\vec{G}|^2 + |\vec{R}|^2$$

In UQFF, this maps to:

- Layer 1 (Compressed): G-field term = standard g_UQFF
 - Layer 2 (Resonance): R-field term = U_m rotational projections
 - Layer 4 (Q-wave): G-R coupling = $(|\vec{G}|)(|\vec{R}|)$
-

7. Full NASA UQFF Layer 1 Equation

$$g_{L1,NASA} = g_{UQFF}(r,t) + Thorium_effect + U_{m,Searl} + Magnetic_buoyancy + g_{aether} + g_{Bifield}$$

Numerical estimate (at $r = 6.371 \times 10^6$ m, Earth surface): - $g_{UQFF} \approx 9.81$ m/s² - $Thorium_effect \approx 5 \times 10^2$ m/s² (at high neutron flux) - $Magnetic_buoyancy \approx 1.35$ m/s² - $g_{aether} \approx 10^{-13}$ m/s² (background) - $g_{Bifield} \approx 10^{-10}$ m/s² (at rest)

8. Integration with UQFF Constants Registry

New terms registered to UQFF global constants table: - α_{Th} = Thorium thrust coupling constant - g_{LIM} = LIM field gradient constant = 8.1 m/s² reference - P/Dr_{Searl} = Searl geometric ratio (>12, integer) - ρ_e = aether density parameter (units N/m³)
