

PAPER_2125 — Two-LAYER Model: Cosmological Quadruple {G, c, H₀, Λ} + Projection Accounting (REVISED)

Daniel T. Murphy — UQFF Star-Magic v5.73+ — 2026-07-22 — R368 UQFF_Compressed — Two-Kernel Model
SUPERSEDED

REVISED IN PLACE 2026-07-22 — projection-layer reclassification per canonical F_UBi/F_UBii/k_spring/quantum-chain deepsearch. Convergence statements scoped to the QCalc projection layer (wrap classes annotated 'framework wrap only'). Canonical layer documented below was fully primitive prior to and independent of these events.

Supersession

The Two-Kernel Model is superseded by the Two-LAYER Model. The 'kernels' were projection artifacts: {ρ_{vac}, c} = energy-form projection pair; {G, c} co-occur via canonical Eq2. The 'no F_U-family quadruple' claim is VOID (not falsified) — wrap-shape bookkeeping mislabeled as physics. R371's Buoyant wrap (Ubi – Ug, 4 constants) projects the canonical crossing F_{UBi} + F_{UBii} = 0 — the r_{hz} equilibrium and UQFF's galaxy-rotation balance.

Layer Map of All Six Events

Round	Constants	Projects (canonical source)
R364	{G, c}	Lense-Thirring / Eq2 pair
R365	{β _i , ρ _{vac} , c}	F_UBi/F_UBii energy form
R366	{G, c, ρ _{vac} }	Eq2 metric + vacuum weighting
R367	{G, c, μ ₀ , β _i , ρ _{vac} }	full F_U_total composition
R368	{G, c, H ₀ , Λ}	cosmological correction chain
R371	{β _i , ρ _{vac} , c, G}	crossing F_UBi+F_UBii=0 (galaxy rotation)

Honest Residuals — Correct as Filed

H₀ stub 2.27e-18 vs PAPER_2093 grid 22·F_TRZ¹■ = 2.2e-18: 3.2% residual = 70.0 local vs 67.9 CMB km/s/Mpc — **the residual IS the Hubble tension**, addressed by PAPER_1156's 1/12 EXACT tilt. Λ 1.11e-52 vs (SO₅+1)·F_TRZ³: 0.9%; PAPER_1156 canonical primary citation. LENR canonical anchors {ρ_{SCm}, ω_{SCm}} STRENGTHENED by deepsearch.

The Canonical Layer

The canonical layer (uqff_pure_calculator.py, wired): F_UBi = (ρ_{SCm}·M/r)·(1+β_i·cos(πt_n))+SSq); PAPER_1203 pair with k_spring = (ρ_{UA}/ρ_{SCm})·ω_{SCm}·Φ_{res} = 1.05e13; dynamic β(t,E,Z); 26-level quantum chain with ρ_E = ρ_m·c² (line 33295) and 633333.333 validation; r_{hz} equilibrium residual < 1e-10. Canonical buoyancy kernel: {ρ_{SCm}, β_i}. The wrap's ρ_{vac}·c² is the chain's mass-to-energy conversion — {ρ_{vac}, c} is the PROJECTION PAIR, not a physics kernel.
