Abstract

This paper presents the complete 12-term F_U_Bi_i integrand in verbatim form. Prior pipeline whitepapers (PAPER_198 through PAPER_256) documented the F_U_Bi_i framework with the first five terms (vacuum repulsion, DPM momentum, DPM gravity, DPM stability, LENR phonon). This paper formally defines Terms 6-12 which were first revealed in the September 14, 2025 Grok 4 deep-analysis thread: k_act cosine activity coupling, k_DE×L_X dark energy-luminosity product, Zeeman magnetic coupling, k_neutron×s_n neutron cross-section term, relativistic center-of-mass correction, F_Sweet vacuum (~10³³ N, negligible), and F_Kozima neutron drop (~10³⁰-10³³ N, the dominant new-term contribution). These seven new terms complete the F_U_Bi_i force integrand to full 12-term status.

- DPM_stability = stability factor from vacuum density modulation

Term 5: LENR Phonon Coupling

$k_{\text{LENR}} \cdot (\omega_{\text{LENR}} / \omega_0)^2$

- $\omega_{\text{LENR}} = 7.85 \times 10^{12} \text{ rad/s}$ (Colman-Gillespie 1.25 THz)
- $\omega_0 = 10^{15} \text{ rad/s}$ (system reference frequency)
- $\text{Ratio} = (7.85 \times 10^{12} / 10^{15})^2 = 6.16 \times 10^{-5}$ dominant LENR driver

Term 6: Activity Coupling (NEW)

$k_{\text{act}} \cdot \cos(\omega_{\text{act}} \cdot t)$

Symbol	Value	Description
k_{act}	10^{-5}	Activity coupling amplitude (calibrated from Chandr
ω_{act}	2p/(12.5 yr) for Cen A ~2p/days for Sgr A* JWST mid-IR ~2p/weeks for M87 jet variable	Activity angular frequency

Physical significance: - Cen A: V-shape jet hit Dec 2024 ? $t_{\text{jet}} \sim 12.5$ yr activity cycle
 - Sgr A*: JWST mid-IR flares Jan-Feb 2025 ? $\tau_{\text{act}} \sim 1/\text{day}$ - M87: jet variability weeks-months - Captures periodic AGN jet activity injection into F_U_Bi_i

Code (verified):

```
k_act = 1e-5 # from 12.5 yr variability
omega_act_t = np.cos(2*np.pi*x / (12.5 * 3.156e7)) # yr to s
```

Term 7: Dark Energy-Luminosity Product (NEW)

$k_{\text{DE}} \cdot L_{\text{X}}$

Symbol	Value	Description
k_{DE}	10^{20} m^3	Dark energy coupling to X-ray luminosity
L_{X}	$\sim 10^4 \text{ W}$ (Cen A)	X-ray luminosity

Product: $k_{\text{DE}} \times L_{\text{X}} \sim 10^{20} \times 10^4 = 10^{24} \text{ N/m}$ Integrated over x_2 : contribution $\sim 10^4 \text{ N}$ for galactic-class systems

Physical significance: Connects cosmological dark energy (via k_{DE} with ? dimension) to the local X-ray radiative output of AGN systems.

Term 8: Zeeman Magnetic Coupling (NEW)

$2q B_0 V \sin \theta \cdot (g \mu_B B_0 / \hbar \omega_0)$

Symbol	Value	Description
q	$1.6 \times 10^{19} \text{ C}$	Electric charge
B_0	$1 \text{ G} = 10^{-4} \text{ T}$ (Cen A); 4.2 G (Jupiter); $1\text{--}30 \text{ G}$ (Crab)	Magnetic field
V	10^{23} m^3	Reference volume element
$\sin \theta$	sinusoidal along integration path	Angular factor
g	$g\text{-factor} (\sim 2)$	Electron $g\text{-factor}$
μ_B	$9.274 \times 10^{-24} \text{ J/T}$	Bohr magneton
$\hbar$	$1.0546 \times 10^{-34} \text{ J}\cdot\text{s}$	Reduced Planck constant
ω_0	10^{12} rad/s	Reference THz frequency

Code (verified):

```
g_muB = 9.274e-24 # J/T
hbar = 1.0546e-34
omega0 = 1e12
term_mag = 2*q*B0*V*np.sin(np.pi*x/1e23) * (g_muB*B0/(hbar*omega0))
```

Result: $\text{term_mag} \sim 10^{20} \text{ N}$ (subdominant for galactic fields, dominant for magnetar $B \sim 10^{11} \text{ T}$)

Physical significance: - Encodes full Zeeman coupling of charged particles to the vacuum magnetic field - At magnetar $B_0 = 4.4 \times 10^{13} \text{ T}$ (B_{crit}): term_mag becomes dominant - Connects to $g\text{-2}$ measurement: $a = (g-2)/2 = 4.74 \times 10^{-5}$ from $g\text{-2}$ fit

Term 9: Neutron Cross-Section Coupling (NEW)

$$k_{\text{neutron}} \cdot s_n$$

Symbol	Value	Description
k_{neutron}	$\sim 10^{30}$ (compact)	Neutron flux-coupling constant
s_n	$\sim 10^{28} \text{ m}^2$ (barns range)	Neutron cross-section

Product: $k_{\text{neutron}} \times s_n \sim 10^{30} \times 10^{28} = 1 \text{ N}$ (per unit path) Integrated: $\sim 10^{23} \text{ N}$ for compact-class pulsars

Physical significance: Direct nuclear neutron interaction term — connects macroscopic gravity integral to nuclear neutron cross-section. Most significant for neutron stars (s_n enhanced to $\sim 10^{28} \text{ m}^2$ at resonance energies).

Term 10: Relativistic Center-of-Mass Correction (NEW)

$$k_{\text{rel}} \cdot (E_{\text{cm,adj}} / E_{\text{cm}})^2$$

Symbol	Description
k_{rel}	relativistic correction coupling constant
$E_{\text{cm,adj}}$	adjusted CM energy (accounting for UQFF vacuum effects)
E_{cm}	reference CM energy (standard Newtonian/SR)

Variant labels in thread: $E_{\text{cm,astro,local,adj,eff,enhanced}} / E_{\text{cm}}$ — these suffixes represent the successive relativistic refinements applied to the energy ratio.

Physical significance: When $E_{\text{cm,adj}} > E_{\text{cm}}$ (vacuum enhancement), this term adds an attractive correction. When $E_{\text{cm,adj}} < E_{\text{cm}}$ (dense matter suppression), it reduces $F_{\text{U_Bi}_i}$.

Term 11: Sweet Vacuum Energy (NEW — Negligible)

$$F_{\text{Sweet,vac}} \sim 10^{33} \text{ N} \quad [\text{explicit parameterization}]$$

Physical significance: Named after the Sweet vacuum energy formulation. Orders 10^{33} N makes this term negligible compared to all other terms. However, it is explicitly parameterized (not dropped) to: 1. Maintain dimensional completeness of the 12-term sum 2. Provide a register for future refinement if vacuum energy precision changes 3. Serve as the “cosmological constant” analog in the force integrand

Term 12: Kozima Neutron Drop (NEW — Dominant Among New Terms)

$$F_{\text{Kozima,neutron_drop}} \sim 10^{30} - 10^{33} \text{ N}$$

Physical significance: - Named after the Kozima LENR model of phonon-mediated neutron formation - At $\sim 10^{30} \text{ N}$: comparable to F_{LENR} phonon term (Term 5) - At $\sim 10^{33} \text{ N}$: exceeds F_{LENR} by 3 orders, becoming the second-dominant term after $k_{\text{LENR}} \times (F_{\text{LENR}} / F_0)^2$ - The neutron drop mechanism: $n \rightarrow p + e^- + \bar{\nu}_e$ with phonon mediation releases energy at the neutron drop scale - Connection to $f_{\text{Heaviside}}$ (PAPER_329): F_{Kozima} activates exactly when $f_{\text{Heaviside}} = 1$ ($s_n > s_{\text{crit}}$)

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **LENR-nuclear** sector of the 9-sector UQFF Lagrangian (see uqff_lagrangian_derivation.py).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_\mu \chi)(\partial^\mu \chi) - V(\chi) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac},[\text{SCm}]} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\chi) = \frac{1}{2}m^2\chi^2 + \frac{\lambda}{4!}\chi^4 + \kappa \cdot \rho_{\text{vac},[\text{SCm}]} \cdot \chi$$

§A.3 Euler-Lagrange Equation of Motion

$$\frac{\delta S}{\delta \chi} = \ddot{\chi} + \omega_{\text{LENR}}^2 \chi - \lambda \cos(\omega_{\text{act}} t) - \sigma_n(\omega) \chi = 0$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \xrightarrow{\text{DPM + ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{\text{4 forces}} F_{U_Bi_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \chi = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac},[\text{SCm}]} / \rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp\left(-\exp\left(-\frac{r-r_0}{\lambda_{\text{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.195 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 5, \quad n_{\text{channel}} = 21/26$$

Since $p_{\text{DVP}} = 5$ is **sub-threshold** (threshold at $p > 26$), the system's vacuum topology inherits sub-threshold damping from the DVP lattice, producing smooth rather than resonant UQFF coupling profiles. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is 10^{-12} s (nuclear phonon damping):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot (1 - e^{-[SSq] \cdot m/M_{\odot}}) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c / r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.
