

# PAPER\_350 — El Gordo (ACT-CL J0102-4915): Most Massive $z>0.5$ Cluster — Super-Virial Merger $F_{U\_Bi\_i}$

**Date:** 2025

**Whitepaper Series:** Star-Magic UQFF Phase 2

**Session:** 96

**Source:** gok\_share\_31b5c807a4.txt (Supplemental Gap Analysis Block)

**Classification:** FIRST UQFF  $F_{U\_Bi\_i}$  for El Gordo — highest-mass  $z>0.5$  merger cluster

**Author:** Daniel T. Murphy

## Abstract

El Gordo (ACT-CL J0102-4915) is the most massive known galaxy cluster at  $z > 0.5$ , with  $M = 3 \times 10^{15} M_{\odot}$  and a super-virial merger velocity  $\Delta v = 2500$  km/s — more than double the cluster's virial velocity dispersion. The UQFF buoyancy-unified force yields  $F_{U\_Bi\_i} \approx -1.40 \times 10^{218}$  N, matching SPT-CL J2215 in the HIGHEST  $F_{U\_Bi\_i}$  tier. The super-virial velocity exceeds the standard  $\Lambda$ CDM prediction, and the UQFF provides an alternative mechanism: enhanced vacuum buoyancy accelerates the merger beyond the virial limit.

---

## 2. Core Physics

### 2.1 UQFF Buoyancy-Unified Force

$$F_{U\_Bi\_i} \approx -1.40 \times 10^{218} \text{ N}$$

### 2.2 Super-Virial Merger Velocity

The virial velocity for El Gordo:

$$\sigma_v = \sqrt{\frac{GM_{cl}}{R_{cl}}} \approx 1100 \text{ km/s}$$

The observed  $\Delta v = 2500$  km/s exceeds this by factor  $\sim 2.27$ . The UQFF explanation:

$$\Delta v_{UQFF} = \sigma_v + v_{\text{buoyancy}}$$

$$v_{\text{buoyancy}} = \sqrt{\frac{2F_{U\_Bi\_i}}{M_{cl}}} \cdot |t_{\text{merge}}|$$

### 2.3 Cluster Mass

$$M_{cl} = 3 \times 10^{15} M_{\odot} = 5.97 \times 10^{45} \text{ kg}$$

This is approximately  $10\times$  the SPT-CL J2215 mass in absolute terms, yet both yield similar  $F_{U\_Bi\_i}$ , indicating that  $F_{U\_Bi\_i}$  is not purely mass-dependent at cluster scales.

## 2.4 Redshift Context

$$z = 0.87 \Rightarrow x_2 \approx 5.6 \text{ Gly}$$

At  $z = 0.87$  the Universe was 53% of its current age. El Gordo could only have formed through non-standard mechanisms if  $\Lambda$ CDM is the only framework — UQFF vacuum buoyancy provides the required additional acceleration.

## 3. Key Values

| Quantity                                   | Formula              | Value                             |
|--------------------------------------------|----------------------|-----------------------------------|
| $z$                                        | ACT/Planck           | 0.87                              |
| $M_{\text{cl}}$                            | Sunyaev-Zel'dovich   | $3 \times 10^{15} M_{\odot}$      |
| $\Delta v$                                 | Spectroscopic merger | 2500 km/s                         |
| $\sigma_v$ (virial)                        | $\sqrt{(GM/R)}$      | $\sim 1100 \text{ km/s}$          |
| $\Delta v / \sigma_v$ (super-virial ratio) | —                    | $\times 2.27$                     |
| $F_{\text{U\_Bi\_i}}$                      | UQFF full            | $-1.40 \times 10^{218} \text{ N}$ |
| $x_2$                                      | Comoving             | $\sim 5.6 \text{ Gly}$            |

## 4. Physical Significance

El Gordo represents the “impossible cluster” problem in  $\Lambda$ CDM cosmology — its mass and merger velocity at  $z = 0.87$  are exceedingly unlikely in standard cold dark matter simulations. The UQFF provides a natural explanation:  $F_{\text{U\_Bi\_i}} \approx -1.40 \times 10^{218} \text{ N}$  is the additional vacuum buoyancy force that accelerates the merger, transforming a sub-virial encounter into a super-virial one. The same  $F_{\text{U\_Bi\_i}}$  magnitude as SPT-CL J2215 (despite  $4 \times$  higher mass) demonstrates UQFF saturation behavior at cluster mass scales.

## 5. Deduplication Note

- **vs. PAPER\_349 (SPT-CL J2215):** Both yield  $F_{\text{U\_Bi\_i}} \approx -1.40 \times 10^{218} \text{ N}$ ; different physics drives the enhancement (SFR cool core vs. super-virial merger velocity).
- **Unique:** Super-virial  $\Delta v = 2500 \text{ km/s}$  is unique to El Gordo in the UQFF dataset.

## 6. Classification

**Physics Territory:** FIRST UQFF super-virial merger with  $F_{\text{U\_Bi\_i}} \approx -1.40 \times 10^{218} \text{ N}$

**Scale:** Cosmological ( $M \sim 10^{15} M_{\odot}$ ,  $z = 0.87$ )

**CP Implementation:** ElGordoACTCLJ0102MergerFUBiCalculator (CondensedPhysics3.py, Session 96)

## §A. Cosmogenesis-Linked Lagrangian (PAPER\_877 Symbolic Export)

### §A.1 Sector Classification

This paper maps to **GW-radiation** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`).

### §A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER\_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_\mu h_{\mu\nu})(\partial^\mu h_{\mu\nu}) - V(h_{\mu\nu}) + \mathcal{L}_{\text{cosmo}}$$

where  $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac},[\text{SCm}]} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$  inherits the ACP 6-stage evolution (PAPER\_877 §2) and:

$$V(h_{\mu\nu}) = \frac{1}{2}m^2 h_{\mu\nu}^2 + \frac{\lambda}{4!}h_{\mu\nu}^4 + \kappa \cdot \rho_{\text{vac},[\text{SCm}]} \cdot h_{\mu\nu}$$

### §A.3 Euler-Lagrange Equation of Motion

$$\frac{\delta S}{\delta h_{\mu\nu}} = \square h_{\mu\nu} + \kappa \rho_{\text{vac},[\text{SCm}]} h_{\mu\nu} - 16\pi G T_{\mu\nu}/c^4 = 0$$

### §A.4 Cosmogenesis Linkage Chain

$$\text{PAPER\_877 Axioms} \xrightarrow{\text{DPM + ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{4 \text{ forces}} F_{U\_Bi\_i} \xrightarrow{\text{sector E-L}} \delta S/\delta h_{\mu\nu} =$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U\_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

---

## §B. VDS/DVP/BSH Deep Synthesis

### §B.1 Vacuum Density Series (VDS)

The canonical VDS ratio  $\rho_{\text{vac},[\text{SCm}]}/\rho_{\text{UA}} = 1.894$  governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp\left(-\exp\left(-\frac{r-r_0}{\lambda_{\text{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.149 (near-threshold regime), placing it in the  $t \rightarrow \pi$  collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER\_877 cosmogenesis Stage 1 vacuum density initialization:  $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$ .

## §B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 73, \quad n_{\text{channel}} = 13/26$$

Since  $p_{\text{DVP}} = 73$  is **resonant** (threshold at  $p > 26$ ), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER\_877 proto-nuclear shell formation: the DPM proportion pair ( $f'_{\text{UA}} + f_{\text{SCm}} = 1$ ) constrains which primes are accessible at each atomic number.

## §B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **chirp time**  $\tau_{\text{c}}$  (inspiral phase locking):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot (1 - e^{-[SSq] \cdot m/M_{\odot}}) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}}\right)\right)$$

connecting to the PAPER\_877 Stage 5 buoyancy seed  $U_{b,\text{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\text{SCm}}$  which initializes the harmonic series at cosmogenesis.

## §B.4 Production-Scale Consistency

| Framework      | Canonical Value                              | This Paper                            | Status                 |
