Abstract

This paper presents the Compressed UQFF formulation, a multi-term master gravity equation that incorporates Newtonian gravity, Hubble expansion, superconductivity via the B/Bcrit flux-quenching factor, environmental coupling, cosmological constant contribution, quantum coherence, fluid dynamics, and dark matter perturbation. The framework is parameterised for seven astrophysical systems and validated via unit test against SGR1745-2900. This is the first UQFF formulation to explicitly incorporate Bardeen-Cooper-Schrieffer (BCS) superconductivity quenching into the gravitational coupling (Linear Meissner form; see PAPER_375 for the exponential form).

1. Master Equation

$$g_{\text{UQFF}}(r, t) = \frac{GM(t)}{r^2} \cdot [1 + H(t, z)] \cdot \left[1 - \frac{B}{B_{\text{crit}}}\right] \cdot [1 + F_{\text{env}}] \\ + (U_{g1} + U_{g2} + U'_{g3} + U_{g4}) + \frac{\Lambda c^2}{3} + \frac{\hbar}{\Delta x \cdot \Delta p} \int (\psi_{\text{total}}^* \hat{H} \psi_{\text{total}} dV) \cdot \frac{2\pi}{t_{\text{Hubble}}} \\ + \rho_{\text{fluid}} V g + (M_{\text{vis}} + M_{\text{DM}}) \left(\frac{\delta \rho}{\rho} + \frac{3GM}{r^3} \right)$$

where $H(t, z) = H_0 t$ (Newtonian cosmological expansion approximation), $H_0 = 2.269 \times 10^{-18} \text{ s}^{-1}$.

4. Validation

Unit test: test_compute_compressed_MUGE(SGR1745-2900) - Expected: **1.782e39 m/s²** - (Dominated by compressed_base × expansion; B/Bcrit = 0.1 → 90% retention)

5. Physical Interpretation

The $[1 - B/B_{\text{crit}}]$ factor models the Meissner effect: as the magnetic field B approaches the critical field B_{crit} , gravitational coupling is quenched—mirroring how a Type-I superconductor expels magnetic flux below B_{crit} . The compressed UQFF thus unifies gravitomagnetic quenching with cosmological expansion and quantum corrections in a single framework. (For Type-II exponential treatment, see PAPER_375.)

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **magnetar-field** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_\mu \phi_B)(\partial^\mu \phi_B) - V(\phi_B) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac},[\text{SCm}]} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_B) = \frac{1}{2}m^2\phi_B^2 + \frac{\lambda}{4!}\phi_B^4 + \kappa \cdot \rho_{\text{vac},[\text{SCm}]} \cdot \phi_B$$

§A.3 Euler-Lagrange Equation of Motion

$$\frac{\delta S}{\delta \phi_B} = \nabla \times (\rho_{\text{SCm}} \mathbf{v} \times \mathbf{B}) + \kappa B_{\text{crit}} \partial_t \phi_B = 0$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \xrightarrow{\text{DPM} + \text{ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{4 \text{ forces}} F_{U_Bi_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi_B =$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac},[\text{SCm}]} / \rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp\left(-\exp\left(-\frac{r - r_0}{\lambda_{\text{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.196 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 41, \quad n_{\text{channel}} = 9/26$$

Since $p_{\text{DVP}} = 41$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **10³ yr** (field decay quiescence):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot (1 - e^{-[SSq] \cdot m/M_{\odot}}) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.
