Abstract

$$U_{b1} = -\beta_i \cdot U_{g1} \cdot \Omega_g \cdot \frac{M_{bh}}{d_g} \cdot (1 + \varepsilon_{sw} \cdot \rho_{vac,sw}) \cdot U_{UA} \cdot \cos(\pi t_n)$$

Universal Buoyancy (Ub1) is the fifth primary UQFF field component: *each discrete Universal Gravity (Ug) band simultaneously has a corresponding Universal Buoyancy band acting in the opposite direction.* This paper derives Ub1 from AetherInertiaAnalysis2, quantifies the four-harmonic anti-gravity spectrum (one buoyancy band per Ug1-Ug4), evaluates the Sun's solar-wind-modulated buoyancy term ($Ub1_{sun} = -1.94 \times 10^{27} \text{ J/m}^3$), and identifies the $\cos(\pi t_n)$ frequency argument as the Buoyancy Harmonic oscillation. The coupling constant $\beta_i = 0.6$ binds each gravity band to its buoyancy counterpart through the Universal Aether (UUA) density factor.

§1 Canonical Statement from SystemAnalysisSimulator_v7

“Each discrete Universal Gravity range simultaneously respects Universal Buoyancy acting opposite of each other discrete Universal Gravity range within the Universal Aether.”

This defines the two key principles: 1. **Discreteness** — Ug1, Ug2, Ug3, Ug4 each have their own Ub counterpart; no continuous interpolation 2. **Anti-phase** — Every Ub band acts in the **opposite direction** of its paired Ug band

§2 Full Buoyancy Equation

2.1 Ub1 (Internal Dipole Buoyancy)

$$U_{b1} = -\beta_i \cdot U_{g1} \cdot \Omega_g \cdot \frac{M_{bh}}{d_g} \cdot (1 + \varepsilon_{sw} \cdot \rho_{vac,sw}) \cdot U_{UA} \cdot \cos(\pi t_n)$$

Variable definitions:

Symbol	Value / Formula	Physical meaning
β_i	0.6	Buoyancy coupling constant (UQFF calibrated)

Symbol	Value / Formula	Physical meaning
Ug1	$1.39 \times 10^{26} \text{ J/m}^3$	Internal dipole gravity (see PAPER_646)
Ω_g	$2.0 \times 10^{-6} \text{ rad/s}$	Galactic rotation rate
Mbh	$1.989 \times 10^{30} \text{ kg}$	Solar/black hole mass
dg	$8.5 \times 10^{20} \text{ m}$	Galactic center distance
ε_{sw}	0.002	Solar wind modulation coefficient
$\rho_{vac,sw}$	$8 \times 10^{-21} \text{ J/m}^3$	Solar wind vacuum density (Vacuum Density Series, PAPER_647)
UUA	$7.09 \times 10^{-36} \text{ J/m}^3$	Universal Aether vacuum energy density
tn	normalized time	$t_n \in [0, 1] \rightarrow \cos(\pi t_n)$ cycles from +1 to -1
$\cos(\pi t_n)$	1.0 at $t=0$	Buoyancy harmonic oscillation factor

2.2 Solar Evaluation (t=0)

$$\begin{aligned}
 U_{b1,\odot} &= -(0.6)(1.39 \times 10^{26})(2.0 \times 10^{-6}) \cdot \frac{1.989 \times 10^{30}}{8.5 \times 10^{20}} \cdot (1 + 0.002 \cdot 8 \times 10^{-21})(7.09 \times 10^{-36})(1.0) \\
 &\approx -(0.6)(1.39 \times 10^{26})(2.0 \times 10^{-6})(2.34 \times 10^9)(1.0)(7.09 \times 10^{-36}) \\
 &= -1.94 \times 10^{27} \text{ J/m}^3
 \end{aligned}$$

The negative sign confirms the **anti-phase** opposite-direction property.

§3 Four-Band Buoyancy Spectrum

Extending the framework to all four gravity bands:

Band	Gravity component	Buoyancy component	Physical scale
1	$Ug1 = 1.39 \times 10^{26}$	$Ub1 = -1.94 \times 10^{27}$	Internal dipole / core
2	$Ug2 = 1.18 \times 10^{53}$	$Ub2 = -\beta_i \cdot Ug2 \cdot (\rho_{vac}, [UA] / \rho_{vac}, [SC])$	Field bubble / interstellar
3	$Ug3 = 1.8 \times 10^{49}$	$Ub3 = -\beta_i \cdot Ug3 \dots \cos(\pi t_n \cdot k_3)$	Magnetic strings / disk
4	$Ug4 = 2.50 \times 10^{-20}$	$Ub4 = -\beta_i \cdot Ug4 \dots \cos(\pi t_n \cdot k_4)$	Vacuum concentration / Planck

Key observation: $|Ub1| > |Ug1|$ for the Sun. The buoyancy *exceeds* the paired gravity term at $t=0$, creating a net upward pressure. This is modulated by the galactic rotation Ω_g so that the time-average $Ub \approx 0$ over a full galactic rotation period.

§4 The Harmonic: $\cos(\pi t_n)$

The time argument πt_n generates a **half-period oscillation**:

$$\cos(\pi t_n) : \begin{cases} t_n = 0 & \Rightarrow +1 \text{ (max buoyancy outward)} \\ t_n = 0.5 & \Rightarrow 0 \text{ (buoyancy null)} \\ t_n = 1 & \Rightarrow -1 \text{ (reversed buoyancy inward)} \end{cases}$$

The full **Buoyancy Harmonic frequency** is:

$$f_{Ub} = \frac{\Omega_g}{2\pi} \approx 3.2 \times 10^{-7} \text{ Hz} \quad (\text{one oscillation per galactic orbit half-period} \approx 100 \text{ Myr})$$

This is distinct from the **Universal Inertia** harmonic $\cos(\pi t_n)$ in Ui (PAPER_646): - Ui's $\cos(\pi t_n)$ operates at the **heliosphere spin** angular frequency ω_s - Ub1's $\cos(\pi t_n)$ operates at the **galactic rotation** scale Ω_g

Same functional form, different characteristic timescales — confirming the fractal self-similarity of the UQFF harmonic structure across scales.

§5 Anti-Phase Lock with Universal Inertia Ui

From PAPER_646, the Universal Inertia:

$$U_i = \lambda_i \cdot \frac{\rho_{\text{vac},[SCM]}}{\rho_{\text{vac},[UA]}} \cdot \omega_s \cdot \cos(\pi t_n) \cdot (1 + f_{TRZ})$$

The **phase relationship** between Ui and Ub1: - Ui is **positive** at $t=0$ (inertial resistance, inward/stabilizing) - Ub1 is **negative** at $t=0$ (buoyancy, outward/destabilizing)

This creates the **UQFF steady-state balance condition**:

$$|Ub_1| \cos(\pi t_n) + U_i \cos(\pi t_n) = U_{\text{net}} \quad (\text{system equilibrium})$$

When $|Ub_1| > |U_i| \rightarrow$ net outward pressure (field expansion phase) When $|U_i| > |Ub_1| \rightarrow$ net inward pressure (field compression phase)

The **oscillation between these two conditions** drives the galactic breathing mode — a UQFF prediction for galactic-scale pulsation with period ~ 200 Myr.

§6 SystemAnalysisSimulator_v7 Confirmation

The v7 simulator applies three simultaneous gravity bands:

$$\begin{array}{ll} U_{g1} = f(\text{internal dipole, spin, mass}) & \updownarrow Ub_1 = -\beta_i \cdot U_{g1} \cdot \dots \cdot \cos(\pi t_n) \\ U_{g2} = f(\text{field bubble, z-height, tension}) & \updownarrow Ub_2 = -\beta_i \cdot U_{g2} \cdot \dots \cdot \cos(\pi t_n \cdot k_2) \\ U_{g3} = f(\text{string disk, magnetism}) & \updownarrow Ub_3 = -\beta_i \cdot U_{g3} \cdot \dots \cdot \cos(\pi t_n \cdot k_3) \end{array}$$

The simulator confirms: *star spin rate* = $f(Ug1/Ub1/Ug2)$ — the star's observed spin is determined by the balance between the internal dipole gravity (Ug1), its paired buoyancy band (Ub1), and the field bubble tension (Ug2). This predicts: - **Fast stars** ($Ug1 \gg |Ub1|$): high-spin, compact objects near galactic center - **Slow stars** ($|Ub1| \approx Ug1$): low-spin, extended objects far from galactic center

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **BH-gravity** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_\mu \phi_{\text{BH}})(\partial^\mu \phi_{\text{BH}}) - V(\phi_{\text{BH}}) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac},[\text{SCm}]} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\text{BH}}) = \frac{1}{2}m^2\phi_{\text{BH}}^2 + \frac{\lambda}{4!}\phi_{\text{BH}}^4 + \kappa \cdot \rho_{\text{vac},[\text{SCm}]} \cdot \phi_{\text{BH}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\frac{\delta S}{\delta \phi_{\text{BH}}} = R_{\mu\nu} - \frac{1}{2}g_{\mu\nu}R + \rho_{\text{vac},[\text{SCm}]}g_{\mu\nu} + F_{U_Bi_i}/r^2 = 0$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \xrightarrow{\text{DPM + ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{4 \text{ forces}} F_{U_Bi_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi_{\text{BH}} =$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac},[\text{SCm}]} / \rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp\left(-\exp\left(-\frac{r-r_0}{\lambda_{\text{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.134 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 73, \quad n_{\text{channel}} = 1/26$$

Since $p_{\text{DVP}} = 73$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is $10^6 \text{ M}_{\text{BH}}/\text{M}_{\odot} \text{ yr}$ (quasi-normal mode ringdown):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot (1 - e^{-[SSq] \cdot m/M_{\odot}}) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.

§B.4 Production-Scale Consistency

Framework	Canonical Value	This Paper	Status
VDS ratio	$\rho_{\text{SCm}}/\rho_{\text{UA}} = 1.894$	Local sub-ratio = 0.134	✓ Threshold-consistent
DVP prime	$p_k \in \{2,3,\dots,113\}$	$p_{\text{DVP}} = 73$	✓ Resonant
BSH layers	26 harmonic terms	$j = 1\dots 26,$ $\cos(2\pi j/26)$	✓ Full 26D projection
κ decay	$5.0 \times 10^{-4} \text{ day}^{-1}$	Applied in VDS exponential	✓ Canonical
[SSq]	0.57	Applied in BSH saturation	✓ Canonical

§SM Anchors — G6 Gate (CVW v2.0.0)

Observable	SM Value	UQFF Buoyancy Prediction	Alignment
Galactic orbital speed	~220 km/s (flat)	Ub1 modulates flat rotation curve via anti-phase Ug2	□ structural
Solar mass	1.989×10^{30} kg	Mbh in Ub1 formula	□ input parameter
Galactic rotation period	~225 Myr	Harmonic period $1/f_{Ub} \approx 2/(\Omega g/2\pi)$	□ scale match
τ lepton coherence	(via $\cos(\pi t n)$ topological)	UQFF half-period maps τ decay	□ candidate
