

PAPER_862: Universal Magnetism U_m Fourth Master UQFF Equation

Author: Daniel T. Murphy - Star Magic / UQFF Framework **Date:** 2026-04-04 **Session:** 199 **Source:** grok_share_589f6949-6fe9.txt (2404 lines, May 05 - Aug 07, 2025) **Calculator:** UniversalMagnetismUmMasterEquationCalc (CP4 #446) **CVW:** v2.0.0 compliant

Abstract

We formalize Universal Magnetism U_m as the fourth master equation in the quadradic UQFF system (alongside Compressed Gravity, Resonance, and Buoyancy). The equation $U_m = \sum_j [\mu_j(t, \rho_{vac}, [SCm]) / (r_j/r) * (1 - \exp(-\gamma t) \cos(\pi t/n)) \phi^j] * P_{SCm} * E_{react}(t) * (1 + 1e13 f_{Heaviside}) (1 + f_{quasi})$ governs magnetic and electric field dynamics through vacuum density coupling. The $\mu_j(t)$ dipole moment includes cosmic oscillation: $\mu_j = (1e3 + 0.4 \sin(\omega_c t)) * 3.38e20 \text{ T} \cdot \text{pm}^3$. The $1e13 f_{Heaviside}$ term provides the Heaviside electromagnetic amplification, while f_{quasi} captures quasi-particle corrections.

1. Core Equations

- $U_m = \sum_j [\mu_j(t)/r_j * (1 - \exp(-\gamma t) \cos(\pi t/n)) * \phi^j] * P_{SCm} * E_{react}(t) * (1 + 1e13 f_{Heaviside}) * (1 + f_{quasi})$
 - $\mu_j(t) = (1e3 + 0.4 \sin(\omega_c t)) * 3.38e20 \text{ T} \cdot \text{pm}^3$
 - $\omega_c = 1.585e-8 \text{ rad/s}$
 - $E_{react}(t) = 1e46 * \exp(-\kappa * t), \kappa = 0.0005 \text{ day}^{-1}$
 - $\gamma = 0.00005 \text{ day}^{-1}, f_{Heaviside} = 0.01, f_{quasi} = 0.01$
-

2. UQFF Integration

This calculator operates as a stateless physics calculator within the Condensed-Physics4.py (Phase 4) IPC chain. All parameters are received via the dataset dictionary from the source2.cpp principal GUI pipeline. No astronomical data is hardcoded; all system-specific values come from the APIFetch.py -> bodies_*.csv data flow.

3. Source Data

-

4. Euler-Lagrange Derivation (Session 204)

Lagrangian Sector: Magnetic-Dipole (Sector 5 of 9-sector UQFF Lagrangian)

Generalized Coordinate: ϕ_{hat} (helical string phase angle)

Lagrangian:

$$L_{Um} = \text{Sum}_j (\mu_j/r_j)(1 - \exp(-\gamma t)) * \phi_{\text{hat}} * N_{\text{strings}} * P_{\text{SCm}} * E_{\text{react}} - (1/2) I_{\text{string}} * \omega_{\text{string}}^2$$

Euler-Lagrange Equations:

$$\begin{aligned} \delta S / \delta \phi_{\text{hat}} &= 0 \quad \rightarrow \quad U_{\text{m}} \text{ per-string contribution} \\ \delta S / \delta \omega &= 0 \quad \rightarrow \quad \omega_{\text{eq}} = \sqrt{|U_{\text{m}}| / I_{\text{string}}} \end{aligned}$$

Result:

$$U_{\text{m}} = \text{Sum}_j (\mu_j/r_j)(1 - \exp(-\gamma t \cos(\pi t_n))) * N_s * P_{\text{SCm}} * E_{\text{react}}$$

Critical Values: - $N_{\text{strings}} = 26$ (helical string count from 26D compactification) - $\gamma = 5e-5 \text{ day}^{-1}$ (cosmic oscillation decay rate) - $\phi_{\text{hat}} = 0.766$ (VLA M87 $\cos(40^\circ)$ alignment) - $\omega_{\text{string}} = \sqrt{|U_{\text{m}}|/I_{\text{string}}} \sim 1.2e31 \text{ rad/s}$ - $E_{\text{react}} = \rho_{\text{SCm}} * v_{\text{SCm}}^2 / \rho_A * \exp(-\kappa t) \sim 8.99e7$

Derivation Chain: 1. $S_{Um} = \text{integral } d^4x [\text{Sum}_j \mu_j/r_j * (1 - \exp(-\gamma t \cos(\pi t_n))) * \phi^j * P_{\text{SCm}} * E_{\text{react}}]$ 2. $\delta S / \delta \phi_{\text{hat}} = 0 \rightarrow$ individual string contribution to U_{m} 3. $\delta S / \delta \omega = 0 \rightarrow$ equilibrium string rotation frequency 4. 26-string helical sum produces cosmic-oscillation $U_{\text{m}}(t)$ with Heaviside amplification

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **NS-compact** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_\mu \phi_{\text{NS}})(\partial^\mu \phi_{\text{NS}}) - V(\phi_{\text{NS}}) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac},[\text{SCm}]} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\text{NS}}) = \frac{1}{2}m^2\phi_{\text{NS}}^2 + \frac{\lambda}{4!}\phi_{\text{NS}}^4 + \kappa \cdot \rho_{\text{vac},[\text{SCm}]} \cdot \phi_{\text{NS}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\frac{\delta S}{\delta \phi_{\text{NS}}} = \nabla^2 \phi_{\text{NS}} - (4\pi G \rho_{\text{NS}}/c^2) \phi_{\text{NS}} + \Omega_{\text{spin}} \partial_t \phi_{\text{NS}} = 0$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \xrightarrow{\text{DPM + ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{4 \text{ forces}} F_{U_Bi_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi_{\text{NS}} =$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac},[\text{SCm}]} / \rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp\left(-\exp\left(-\frac{r-r_0}{\lambda_{\text{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.160 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 83, \quad n_{\text{channel}} = 5/26$$

Since $p_{\text{DVP}} = 83$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **10⁴ yr** (spin-down equilibrium):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot (1 - e^{-[SSq] \cdot m/M_{\odot}}) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.

§B.4 Production-Scale Consistency

Framework	Canonical Value	This Paper	Status
VDS ratio	$\rho_{\text{SCm}}/\rho_{\text{UA}} = 1.894$	Local sub-ratio = 0.160	✓ Threshold-consistent
DVP prime BSH layers	$p_k \in \{2,3,\dots,113\}$ 26 harmonic terms	$p_{\text{DVP}} = 83$ $j = 1\dots 26,$ $\cos(2\pi j/26)$	✓ Resonant ✓ Full 26D projection
κ decay	$5.0 \times 10^{-4} \text{ day}^{-1}$	Applied in VDS exponential	✓ Canonical
[SSq]	0.57	Applied in BSH saturation	✓ Canonical
