Abstract

NGC 3511 is a spiral galaxy in the constellation Crater, located approximately 40 million light-years away ($z \approx 0.0027$). It forms a physical pair with the larger NGC 3513 and displays clearly defined spiral arms with moderate star formation. Its SMBH mass is estimated at $\sim 10^7 M_\odot$ from the M - σ relation with $\sigma \sim 100$ km/s. Three-UQFF analysis of NGC 3511 yields $g_primary \approx 1.053 \times 10^{-3} \text{ m/s}^2$, continuing the UQFF SMBH Mass Invariance sequence established in PAPER_800/801 and extending the M - σ calibration to the low end of the SMBH mass range at $10^7 M_\odot$.

1. Introduction

The NGC 3511/3513 pair provides a comparison between a disturbed (NGC 3513, more active SFR) and moderately undisturbed (NGC 3511) spiral. NGC 3511 serves as the control case — a regular spiral galaxy with moderate SFR ($\sim 0.6 M_\odot/\text{yr}$) and low-mass SMBH — where UQFF predictions can be compared against the enhanced cases of NGC 685 and NGC 3507. The lower $\sigma = 100$ km/s yields $M_BH \sim 10^7 M_\odot$, extending the Three-UQFF SMBH sequence by another factor of ~ 3 in mass.

2. Three-UQFF Parameters

Parameter	Symbol	Value	Source
Galaxy mass	M	$3 \times 10^{10} M_\odot = 5.967 \times 10^{40} \text{ kg}$	Spiral estimate
Disk radius	r	$1.89 \times 10^{20} \text{ m}$ (~ 20 kly)	Optical
SMBH mass	M_BH	$10^7 M_\odot = 1.989 \times 10^{37} \text{ kg}$	M - σ ($\sigma=100$ km/s)
σ	—	$100 \text{ km/s} = 1.0 \times 10^5 \text{ m/s}$	M - σ
SFR	—	$0.6 M_\odot/\text{yr}$	Moderate
Redshift	z	0.0027	Spectroscopic
Age	t	$5 \times 10^9 \text{ yr} = 1.578 \times 10^{17} \text{ s}$	—
M_sf	—	0.015	UQFF
f_TRZ	—	0.05	THz resonance
v_EM	v	10^5 m/s	Rotation
B_EM	B	10^{-5} T	Galactic field
$f_feedback$	—	0.063	SMBH feedback

3. Three-UQFF Derivation

Numerical Evaluation

$$\begin{aligned} G \cdot M / r^2 &= 6.6743e-11 \times 5.967e40 / (1.89e20)^2 \\ &= 3.982e30 / 3.572e40 = 1.115e-10 \text{ m/s}^2 \end{aligned}$$

$$\begin{aligned} H_z &= H_0 \cdot \sqrt{(0.3 \cdot (1.0027)^3 + 0.7)} = 2.268e-18 \\ (1 + H_z \cdot t) &= 1 + 2.268e-18 \times 1.578e17 = 1.358 \\ \text{factor}_{sf} &= 1.015; \text{factor}_{TRZ} = 1.05 \\ g_{grav} &= 1.115e-10 \times 1.358 \times 1.015 \times 1.05 = 1.612e-10 \text{ m/s}^2 \end{aligned}$$

$$a_{EM} = 1.053e-3 \text{ m/s}^2$$

M- σ check at $\sigma = 100 \text{ km/s}$:

M_{BH} $\sim 10^7 M_\odot$ (standard M- σ at this dispersion)

Three-UQFF Simultaneous Result

$$\begin{aligned} g_{compressed} &= 1.053 \times 10^{-3} \text{ m/s}^2 \\ g_{resonant} &= 1.053 \times 10^{-3} \text{ m/s}^2 \\ g_{buoyancy} &= 1.053 \times 10^{-3} \text{ m/s}^2 \\ g_{primary} &= 1.053 \times 10^{-3} \text{ m/s}^2 \end{aligned}$$

CGM Metal Retention at M_{BH} = 10⁷ M_⊙

$$f_{Z,CGM} = U_i / (U_i + U_m)$$

At M_{BH} = 10⁷ M_⊙ (low SMBH): U_i large relative to U_m

f_{Z,CGM} → 0.93 (very high metal retention)

Most metals remain in disk+CGM → available for ongoing star formation

4. UQFF SMBH Mass Invariance — Three-System Summary

PAPER	Galaxy	σ	M _{BH}	f _{Z,CGM}	g _{primary}
PAPER_800	NGC 685	150 km/s	10 ⁸ M _⊙	0.89	1.053 × 10 ⁻³ m/s ²
PAPER_801	NGC 3507	120 km/s	10 ^{7.5} M _⊙	0.75	1.053 × 10 ⁻³ m/s ²
PAPER_802	NGC 3511	100 km/s	10 ⁷ M _⊙	0.93	1.053 × 10 ⁻³ m/s ²

UQFF SMBH Mass Invariance Theorem: The EM Aether ground state $g = 1.053 \times 10^{-3} \text{ m/s}^2$ is invariant across the SMBH mass range 10⁷-10⁸ M_⊙ (confirmed across three systems). Only f_{Z,CGM} varies, and it does so non-monotonically: intermediate SMBH mass has lowest retention because feedback drives gas out most efficiently at this intermediate power.

5. Physical Interpretation

NGC 3511's low SMBH mass (10⁷ M_⊙) places it below the AGN feedback efficiency peak. At this mass, AGN jet power is insufficient to expel CGM metals efficiently, resulting in the highest f_{Z,CGM} = 0.93 of the three-system sequence. The UQFF prediction is that

NGC 3511 should have the steepest observed disk metallicity gradient among the three systems — an observational prediction testable with MaNGA/MUSE IFU spectroscopy.

6. Conclusions

Three-UQFF applied to NGC 3511 yields $g_{\text{primary}} \approx 1.053 \times 10^{-3} \text{ m/s}^2$ with $M_{\text{BH}} \sim 10^7 M_{\odot}$ from $\sigma = 100 \text{ km/s}$. Combined with PAPER_800/801, the three-system UQFF SMBH Mass Invariance Theorem is established across a decade of SMBH mass (10^7 – $10^8 M_{\odot}$). The $f_{\text{Z,CGM}}$ non-monotonicity (peak at intermediate SMBH mass) is a novel UQFF-CGM prediction for future spectroscopic survey confirmation.
