PAPER_1002: AGN Accretion Buoyancy-Corrected Eddington Luminosity

Abstract

The standard Eddington luminosity $L_{\text{Edd}} = 4\pi G M m_p c / \sigma_T$ is modified by SCm buoyancy. The correction factor $(1 + F_{\{U,B\}}/(GM/r^2))$ accounts for vacuum buoyancy opposing gravitational collapse, raising the effective Eddington limit.

1. Corrected Eddington Luminosity

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot (1 + \rho_{\text{SCm}} \cdot V \cdot S_{26}^3 / (GM/r^2))$$

For $M = 108 \text{ MM}_{\text{sun}}$: $L_{\text{Edd}} = 1.26 \times 10^{39} \text{ W}$.

2. Implications

Super-Eddington accretion rates become permissible when buoyancy corrections reduce the effective radiation pressure barrier.
