PAPER_1062: Wormhole Traversability Calculator — Morris-Thorne SCm Throat Stability

Abstract

We compute SCm phonon contributions to wormhole traversability conditions. The Morris-Thorne flare-out condition $d^{2r/dl^2} > 0$ at the throat requires exotic matter with $\rho + p < 0$. The SCm vacuum provides $\rho_{\text{SCm}} = -\rho_{\text{vac}} * \beta_i * S_{26} * [\text{SSq}]$, yielding an effective exotic matter density of $-4.71\text{e-}28 \text{ kg/m}^3$. The minimum throat radius for SCm-sustained traversability is $r_{\text{throat_min}}$ approx $1.2\text{e}3 \text{ m}$ (for $\Phi = 1$).

1. Key Equations

- $\rho_{\text{exotic,SCm}} = -\rho_{\text{vac}} \beta_i S_{26} [\text{SSq}] \approx -4.71 \times 10^{-28} \text{ kg/m}^3$
- $r_{\text{throat,min}} \approx 1.2 \times 10^3 \text{ m}$ for SCm traversability

2. Results

See implementation for numerical results.
