Abstract

Spiral galaxies evolve under pattern-speed-driven star-formation torques whose cumulative gravitational amplitudes differ fundamentally from static NFW or Keplerian assumptions. Within the UQFF (Unified Quantum Field Framework) 2.0 pipeline, a dimensionless spiral torque factor $\tau_{\text{spiral}} = (M_{\text{gas}}/M) \times \Omega_p \times t$ accumulates over cosmic time and multiplies the base gravitational term. At 10 Gyr the amplifier reaches $\tau = 2.046$, boosting effective gravity by a factor of $3.046\times$. The torque rate $d\tau/dt = 6.483 \times 10^{-18} \text{ s}^{-1}$ exceeds H_0_{SH0ES} ($73.0 \text{ km/s/Mpc} = 2.366 \times 10^{-18} \text{ s}^{-1}$) by a factor of 2.741, establishing a new UQFF cosmic-rate comparison.

3. Derivation

3.1 Dimensionless Spiral Torque

The spiral arm torque amplifier in UQFF 2.0 is defined as a dimensionless running accumulation of pattern momentum:

$$\tau_{\text{spiral}}(t) = \frac{M_{\text{gas}}}{M} \cdot \Omega_p \cdot t$$

- $f_{\text{gas}} = 109 / 1011 = \mathbf{0.01}$
- $\Omega_p = 20.0 \times 103 / 3.086 \times 1019 = \mathbf{6.483 \times 10^{-16} \text{ rad/s}}$
- $t (10 \text{ Gyr}) = 10 \times 109 \times 3.15576 \times 10^7 = \mathbf{3.156 \times 10^{17} \text{ s}}$

$$\tau_{\text{spiral}}(10 \text{ Gyr}) = 0.01 \times 6.483 \times 10^{-16} \times 3.156 \times 10^{17} = \boxed{2.046}$$

3.2 Gravity Amplification

The UQFF 2.0 pipeline applies τ as a multiplicative stage:

$$g_{\text{pipeline}}(t) = \frac{GM}{r^2} \cdot \underbrace{(1 + H_z t)}_{\text{Hubble}} \cdot \underbrace{(1 + \tau_{\text{spiral}})}_{\text{torque}} \cdot \underbrace{(1 - B/B_{\text{crit}})}_{\text{SC}} \cdot \underbrace{(1 + f_{\text{TRZ}})}_{\text{TRZ}}$$

At $t = 10 \text{ Gyr}$, $z = 0$:

$$g_{\text{amp}} = 1 + \tau_{\text{spiral}} = 1 + 2.046 = \boxed{3.046}$$

Effective gravity is **3× stronger at 10 Gyr** than at formation, driven entirely by spiral arm pattern momentum accumulation.

3.3 Pattern Period

$$T_{\text{pattern}} = \frac{2\pi}{\Omega_p} = \frac{2\pi}{6.483 \times 10^{-16}} = 9.692 \times 10^{15} \text{ s} = \boxed{307 \text{ Myr}}$$

A spiral arm completes one full rotation pattern in 307 Myr — consistent with observed grand-design spiral arm lifetimes.

3.4 Torque Rate vs Hubble Rate

$$\frac{d\tau}{dt} = f_{\text{gas}} \cdot \Omega_p = 6.483 \times 10^{-18} \text{ s}^{-1}$$

$$H_{0,\text{SHOES}} = \frac{73.0 \times 10^3}{3.086 \times 10^{22}} = 2.366 \times 10^{-18} \text{ s}^{-1}$$

$$\frac{d\tau/dt}{H_0} = \frac{6.483 \times 10^{-18}}{2.366 \times 10^{-18}} = \boxed{2.741}$$

The spiral torque accumulation rate exceeds the Hubble expansion rate by 2.741×. This means spiral arm gravitational evolution is cosmologically faster than universal expansion, a key UQFF prediction distinguishing galactic internal dynamics from global metric expansion.

4. Physical Interpretation

The spiral arm torque factor captures how non-axisymmetric mass flows (gas infall, density wave sweeping, star formation) cumulatively torque the gravitational potential. In UQFF 2.0, this is written as a dimensionless running factor on the total gravity pipeline. The key results:

- **$\tau_{\text{spiral}}(10 \text{ Gyr}) = 2.046$** — Spiral galaxies experience $>3\times$ internal gravity enhancement relative to their formation epoch
- **$T_{\text{pattern}} = 307 \text{ Myr}$** — Sets the natural clock for spiral arm-driven enrichment cycles (OB association lifetimes, molecular cloud compression cycles)
- **$d\tau/dt / H_0 = 2.741$** — Torque evolution rate $2.7\times$ faster than cosmic expansion: internal galactic structure evolves more rapidly than expanding-universe metrics suggest

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **NS-compact** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u \phi_{\text{NS}})(\partial^\mu \phi_{\text{NS}}) - V(\phi_{\text{NS}}) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac},[\text{SCm}]} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\text{NS}}) = \frac{1}{2}m^2\phi_{\text{NS}}^2 + \frac{\lambda}{4!}\phi_{\text{NS}}^4 + \kappa \cdot \rho_{\text{vac},[\text{SCm}]} \cdot \phi_{\text{NS}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\frac{\delta S}{\delta \phi_{\text{NS}}} = \nabla^2 \phi_{\text{NS}} - (4\pi G \rho_{\text{NS}}/c^2)\phi_{\text{NS}} + \Omega_{\text{spin}} \partial_t \phi_{\text{NS}} = 0$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \xrightarrow{\text{DPM} + \text{ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{4 \text{ forces}} F_{U_Bi_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi_{\text{NS}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac},[\text{SCm}]} / \rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp! \left(- \exp! \left(- \frac{r - r_0}{\lambda_{\text{VDS}}} \right) \right)$$

For this system, the local VDS sub-ratio is 0.124 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 23, \quad n_{\text{channel}} = 23/26$$

Since $p_{\text{DVP}} = 23$ is **sub-threshold** (threshold at $p > 26$), the system's vacuum topology inherits sub-threshold damping from the DVP lattice, producing smooth rather than resonant UQFF coupling profiles. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **104 yr** (spin-down equilibrium):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot (1 - e^{-[SSq] \cdot m/M_{\odot}}) \cdot \cos! \left(\frac{2\pi j}{26} \right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh! \left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}} \right) \right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.
