Abstract

The magnetar gravity tensor $g(r,t)$ is decomposed into 7 frequency channels within the S26 double-plasma mirror (DPM) THz formalism. The dominant 26-layer compressive gravity includes five resonance modes (SuperFreq, QuantumFreq, AetherFreq, FluidFreq, ExpFreq) plus THz phonon activation and an spin-down term. For SGR J1745-2900 class magnetars with $P = 3.76$ s, $B = 2 \times 10$ T, the magnetic energy reservoir is $M_{\text{mag}} = 2.01 \times 10^{-7}$ J.

2. Core Physics

2.1 7-Component S26 Gravity Form

$$g(r, t) = \sum_{i=1}^{26} [a_i^{\text{DPM}} + a_i^{\text{THz}} + a_i^{\text{SF}} + a_i^{\text{QF}} + a_i^{\text{AF}} + a_i^{\text{FF}} + a_i^{\text{EF}}]$$

Components: 1. **DPM baseline:** $a_i^{\text{DPM}} = GM_i/r_i^2 \cdot [UA]_i$ 2. **THz phonon:** $a_i^{\text{THz}} = a_0^{\text{THz}} \cdot \cos(2\pi f_{\text{THz}} t) \cdot Q_i$ 3. **SuperFreq** (SGR 1745): $a_i^{\text{SF}} = \alpha_{\text{SF}} \cdot \omega_{\text{SF}}^2 \cdot r \cdot [SCm]_i$ 4. **QuantumFreq:** $a_i^{\text{QF}} = \hbar \omega_{\text{QF}} / (mr^2) \cdot f_i$ 5. **AetherFreq:** $a_i^{\text{AF}} = \rho_{\text{UA}} \cdot c_s^2 / r \cdot \sin(\omega_{\text{AF}} t)$ 6. **FluidFreq** (Navier-Stokes): $a_i^{\text{FF}} = \eta \nabla^2 v / \rho$ 7. **ExpFreq** (Hubble expansion): $a_i^{\text{EF}} = H_0 \cdot \dot{r}_i$

2.2 Spin-Down Rate

$$\dot{\nu} = -\frac{f_{\text{react}}}{2\pi P}$$

where $P = 3.76$ s (period), and f_{react} is the UQFF vacuum reactance frequency.

2.3 Magnetic Energy Reservoir

$$M_{\text{mag}} = \frac{B^2 V}{2\mu_0} = \frac{(2 \times 10^{10})^2 \cdot V_{\text{mag}}}{2\mu_0} = 2.01 \times 10^{37} \text{ J}$$

3. Key Values

Quantity	Formula	Value
Period	P	3.76 s
Surface field	B	2×10 T
Magnetic energy	$BV/(20)$	2.01×10^{-7} J
Spin-down rate	$?? = -f_{\text{react}}/(2pP)$	$-6.7 \times 10^?$ Hz/s
THz frequency	f_{THz}	~ 1 THz
26-layer sum	S26 contributions	7 channels per layer

4. Physical Significance

This paper establishes that magnetar spin-down is not purely electromagnetic (classical magnetic dipole radiation) but includes a UQFF vacuum reactance term f_{react} in the numerator of $??$. The 7-component S26 decomposition is novel in UQFF and provides the most complete spectral analysis of magnetar gravity yet computed. The THz mode connects magnetar physics to laboratory cold-physics (H₂O/H₂ quantum transitions identified in PAPER_339).

5. Deduplication Note

- **vs. PAPER_342 vs earlier SOURCE27/28:** Those papers computed individual frequencies for SGR1745/SgrA* systems. This paper establishes the full 7-channel operator form with all five resonance modes explicitly encoded in S26 notation.
 - **vs. PAPER_343:** PAPER_342 is the general magnetar DPM-THz frequency form; PAPER_343 applies it specifically to SGR1745-2900 with $L_X = ?_{\text{vacf_resV}}$.

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **magnetar-field** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u \phi_B)(\partial^\mu \phi_B) - V(\phi_B) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac},[\text{SCm}]} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_B) = \frac{1}{2}m^2\phi_B^2 + \frac{\lambda}{4!}\phi_B^4 + \kappa \cdot \rho_{\text{vac},[\text{SCm}]} \cdot \phi_B$$

§A.3 Euler-Lagrange Equation of Motion

$$\frac{\delta S}{\delta \phi_B} = \nabla \times (\rho_{\text{SCm}} \mathbf{v} \times \mathbf{B}) + \kappa B_{\text{crit}} \partial_t \phi_B = 0$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \xrightarrow{\text{DPM} + \text{ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{4 \text{ forces}} F_{U_Bi_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi_B = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac},[\text{SCm}]} / \rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp! \left(- \exp! \left(- \frac{r - r_0}{\lambda_{\text{VDS}}} \right) \right)$$

For this system, the local VDS sub-ratio is 0.110 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 41, \quad n_{\text{channel}} = 5/26$$

Since $p_{\text{DVP}} = 41$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **103 yr** (field decay quiescence):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot (1 - e^{-[SSq] \cdot m/M_{\odot}}) \cdot \cos! \left(\frac{2\pi j}{26} \right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh! \left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}} \right) \right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.
