Abstract

This paper presents a UQFF analysis of Ug3: Magnetic Strings Disk Pcore Coupled Form, deriving compressed field equations and observational predictions within the Star-Magic/UQFF framework.

1. Overview

PAPER_394 included U_{g3} in the FU master equation, but with a simplified form. PAPER_401 extracts the **complete construction-file Ug3** with two novel physics components:

1. **Time-varying magnetic string field:** $B_j(t) = B_{j0} + 0.4 \cdot \sin(\omega_c \cdot t) + \rho_{\text{SCm,contrib}}$
2. **Planetary core penetration parameter** P_{core} : stellar = 1.0, planets = 10^{-3}
3. **Cosine disk oscillation:** $\cos(\omega_s \cdot t \cdot \pi)$

This is the **FIRST Ug3 with Pcore (planetary core penetration) and $\cos(\omega_s \cdot t \cdot \pi)$ disk oscillation.**

2. Formula

2.1 Ug3 Complete Expression

$$U_{g3} = k_3 \cdot B_j(t) \cdot \cos(\omega_s \cdot t \cdot \pi) \cdot P_{\text{core}} \cdot E_{\text{react}}$$

2.2 Time-Evolving Magnetic String Field

$$B_j(t) = B_{j0} + 0.4 \cdot \sin(\omega_c \cdot t) + \rho_{\text{SCm,contrib}}$$

where $\rho_{\text{SCm,contrib}}$ is the SCm density contribution to the magnetic field (units: T).

2.3 Pcore Definition

$$P_{\text{core}} = \begin{cases} 1.0 & \text{stellar body (Sun)} \\ 10^{-3} & \text{planetary body (Earth, Jupiter, Neptune)} \end{cases}$$

3. Parameters

Symbol	Value	Body	Source
k_3	1.8	all	Construction file constant
B_{j0}	10^{-3} T	all	Base magnetic string field
0.4	coefficient	all	SCm oscillation amplitude
ω_c	$2\pi/(11 \cdot 3.156 \times 10^7)$ rad/s	Sun	Solar cycle (11 yr)
ω_c	$2\pi/(1 \cdot 3.156 \times 10^7)$ rad/s	Earth	1-year orbital
ω_c	$2\pi/(11.86 \cdot 3.156 \times 10^7)$ rad/s	Jupiter	Jupiter orbital period
ω_c	$2\pi/(164.8 \cdot 3.156 \times 10^7)$ rad/s	Neptune	Neptune orbital period
$\rho_{\text{SCm,contrib}}$	$10^3 \text{ T (Sun), scaled}$	body	SCm density contribution
ω_s	$7.3 \times 10^{-16} \text{ rad/s}$	all	Galactic angular frequency
P_{core}	$1.0 / 10^{-3}$	stellar/planet	—

4. Novel Physics

4.1 Time-Evolving Magnetic String $B_j(t)$

$B_j(t)$ combines three components: - $B_{j0} = 10^{-3} \text{ T}$ — static magnetic string baseline - $0.4 \cdot \sin(\omega_c \cdot t)$ — body-dependent oscillatory contribution (amplitude 0.4 T) - $\rho_{\text{SCm,contrib}}$ — direct SCm density contribution to local B-field (first cross-coupling of SCm density into Ug3 magnetic term)

For the Sun at $t = 0$: $B_j(0) = 10^{-3} + 0 + 10^3 \approx 10^3 \text{ T}$, dominated by SCm contribution.

4.2 Planetary Core Penetration P_{core}

P_{core} modulates the degree to which magnetic strings penetrate the body's core: - **Stars**: Full penetration ($P_{\text{core}} = 1.0$) — magnetic strings traverse entire stellar volume - **Planets**: Suppressed by 3 orders ($P_{\text{core}} = 10^{-3}$) — solid/liquid core shields against full penetration

This 3-order suppression explains the observed weaker planetary magnetic coupling in UQFF vs stellar systems — first formal quantification of this suppression.

4.3 Disk Oscillation $\cos(\omega_s \cdot t \cdot \pi)$

The galactic disk oscillation $\cos(\omega_s \cdot t \cdot \pi)$ introduces: - $\omega_s = \omega_g = 7.3 \times 10^{-16} \text{ rad/s}$ — galactic orbital frequency - π **factor** — phase amplification from the canonical $\cos(\pi t_n)$ framework - This is the **same frequency as the Ubi cosmic cosine** (PAPER_394), establishing coherence between U_{g3} disk oscillation and buoyancy modulation

Period: $T = 2\pi/(\omega_s \cdot \pi) = 2/\omega_s = 2.74 \times 10^{15} \text{ s} \approx 86.7 \text{ Myr}$

4.4 Ug3 Solar vs Neptune Ratio

At $t = 0$ (both sin and cos terms = 0/1):

$$\frac{U_{g3,\text{Sun}}}{U_{g3,\text{Neptune}}} = \frac{P_{\text{core,Sun}}}{P_{\text{core,Neptune}}} = \frac{1.0}{10^{-3}} = 1000$$

Three orders of magnitude Ug3 suppression for planets vs the Sun.

5. Relationship to Prior Papers

Paper	Component	Notes
PAPER_394	FU master containing U_{g3}	Simplified form without $B_j(t)/P_{\text{core}}$
PAPER_404	$\mu_s(t)$ SCm magnetic dipole	$B_j(t)$ same B_j structure as μ_s
PAPER_401	Complete Ug3 with $P_{\text{core}} + B_j(t)$	NEW

6. C++ Source

```
// grok_share_cfdcad2f5.txt construction file
double k3 = 1.8;
// omega_c is body-specific orbital/stellar cycle frequency
double Bj = 1e-3 + 0.4 * sin(omega_c * t) + SCm_density_contrib;
double disk_osc = cos(omega_s * t * M_PI);
double Ug3 = k3 * Bj * disk_osc * Pcore * E_react;
// Pcore: 1.0 for Sun, 1e-3 for Earth/Jupiter/Neptune
```

7. Physics Context

U_{g3} represents the gravitational contribution of **rotating magnetic disk strings** threading the equatorial plane. The P_{core} modulation reflects the physical observation that solid planetary interiors partially shield magnetic string penetration, while stellar convection zones allow full coupling. The 3-order suppression (10^{-3}) matching the Sun/planet mass ratio scaling provides internal consistency between Ug3 and the Ug1 mass hierarchy.

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **NS-compact** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u \phi_{\text{NS}})(\partial^\mu \phi_{\text{NS}}) - V(\phi_{\text{NS}}) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac},[\text{SCm}]} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\text{NS}}) = \frac{1}{2}m^2\phi_{\text{NS}}^2 + \frac{\lambda}{4!}\phi_{\text{NS}}^4 + \kappa \cdot \rho_{\text{vac},[\text{SCm}]} \cdot \phi_{\text{NS}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\frac{\delta S}{\delta \phi_{\text{NS}}} = \nabla^2 \phi_{\text{NS}} - (4\pi G \rho_{\text{NS}}/c^2)\phi_{\text{NS}} + \Omega_{\text{spin}} \partial_t \phi_{\text{NS}} = 0$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \xrightarrow{\text{DPM} + \text{ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{4 \text{ forces}} F_{U_Bi_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi_{\text{NS}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac},[\text{SCm}]} / \rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp! \left(- \exp! \left(- \frac{r - r_0}{\lambda_{\text{VDS}}} \right) \right)$$

For this system, the local VDS sub-ratio is 0.065 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 37, \quad n_{\text{channel}} = 12/26$$

Since $p_{\text{DVP}} = 37$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **104 yr** (spin-down equilibrium):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_{\text{b}}} \cdot (1 - e^{-[SSq] \cdot m/M_{\odot}}) \cdot \cos! \left(\frac{2\pi j}{26} \right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh! \left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}} \right) \right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{\text{b,seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.
