Abstract

Three sets of five quantum variable documents (15 variables total) were assimilated into the UQFF knowledge base during the Compression Cycle 2 thread. This paper consolidates all 15 variables with their equations, canonical values, and roles within the Unified Field Strength F_U formula. The variables span spatial distances (r_j , d_g), field strengths (F_U , μ_j), dynamics (Ω_g , f_{feedback} , γ), and operational parameters ($f_{\text{Heaviside}}$, H_{SCm} , λ_i , M_{bh} , E_{react}). Together they define the complete parameterization of the UQFF for galactic-scale applications.

1. Introduction

Multiple document sets uploaded to the Grok UQFF thread on May 08, 2025 comprised 15 individual quantum variable definition documents, each providing: - Variable symbol and definition - Value and units - Role in U_m , U_{gi} , U_{bi} , F_U equations - Example calculation for the Sun at $t=0$, $t_n=0$

This paper assimilates all 15 variables as a unified reference set.

2. Set A: Spatial and Field Variables (r_j, d_g, F_U, f_feedback, Ω_g)

r_j — Magnetic String Distance

$$r_j = 1.496 \times 10^{13} m = 100 AU$$

i — Gravity Index

$i \in \{1,2,3,4\}$ (integer index for $U_{g1}, U_{g2}, U_{g3}, U_{g4}$)

Role: Indexes the 4 universal gravity components in F_U summation

$$\Sigma(k_i \cdot U_{gi}) = k_1 \cdot U_{g1} + k_2 \cdot U_{g2} + k_3 \cdot U_{g3} + k_4 \cdot U_{g4}$$

At $t=0$, Sun: $\approx 1.42 \times 10^{53} J/m^3$ (U_{g2} dominant)

H_SCm — Heliosphere Thickness Factor

$H_{SCm} 1(\text{dimensionless})$

Role : Scales heliospheric thickness in U_g

$$U_g = k_2 \cdot (\rho_{vac}, [UA] + \rho_{vac}, [SCm]) \cdot M_s / r^2 \cdot S(r - R_b) \cdot (1 + \delta_s w \cdot v_s w) \cdot H_{SCm} \cdot E_{react}$$

$$\text{Net contribution: } -\lambda_i \cdot U_i \cdot E_{react} \approx -0.138 J/m^3$$

j — Magnetic String Index

j = integer index for magnetic strings in U_m and U_{g3}

*Role : Sgr A * mass scaling galactic gravitational field*
Appears in U_{bi} and U_{g4} as M_{bh}/d_g ratio

μ_j — Magnetic Moment (time-dependent)

 $\omega_c = 2\pi / (3.96 \times 10^8 s)$ (solar magnetic cycle frequency)
 $Att = 0 : \mu_j = 103 \times 3.38 \times 10^{20} = 3.38 \times 10^{23} T \cdot pm^3$
 $Att = 1000 days : (1 - e^{(-\gamma t)} \cdot \cos(\pi \cdot t_n)) \approx 0.049 \rightarrow U_m$ scales accordingly

γ — Reciprocal Decay Rate

$\gamma = 5 \times 10^{-5} \text{ day}^{-1}$

Role: Controls temporal decay of magnetic string effects in U_m

$1 - e^{(-\gamma t)} \rightarrow$ small for $t \ll 1/\gamma \approx 20,000$ days
 At $t=1000$ days: $1 - e^{(-0.05)} \approx 0.049$ (still growing)

E_{react} — Reactor Efficiency Factor

$t_n = t - t_0$ (allow $t_n < 0$)

Role : Time reference in oscillatory terms $\cos(\pi \cdot t_n)$

For $t = 1000 \text{ days}$, $t_n = -1$:

$\cos(\pi \cdot (-1)) = -1$ (phase reversal)

$U_g \rightarrow \text{negative} \rightarrow \text{system in negative regime}$

5. Unified Field Strength — Complete Parameterized Equation

With all 15 variables defined:

$$\begin{aligned} F_U &= \sum_{i=1}^4 [k_i \cdot U_{gi} - \beta_i \cdot U_{gi} \cdot \Omega_g \cdot (M_b h / d_g) \cdot E_{react}] \\ &+ \sum_j [\mu_j(t) / r_j \cdot (1 - e^{\gamma t} - \gamma t) \cdot \cos(\pi \cdot t_n)) \cdot \varphi_j] \\ &\cdot P_S C m \cdot E_{react} \cdot (1 + 1013 \cdot f_{Heaviside}) \cdot (1 + f_{quasi}) \\ &+ H_S C m \cdot (g_\mu \nu + \eta \cdot T_s^{(\mu\nu)}) \\ &- \lambda_i \cdot \sum_i [U_i \cdot E_{react}] \end{aligned}$$

Where all symbols are defined by the 15 quantum variable documents above.

6. Conclusion

The 15 quantum variable documents from the thread_06Jun2025.txt provide the complete parameterization of the UQFF unified field strength F_U . Each variable has been confirmed with numerical values, equations, and solar-scale calculations. Together they establish a fully specified, quantitative framework enabling computation of F_U for any astrophysical system given mass, distance, magnetic field, and temporal parameters.

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **BH-gravity** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u \phi_{\text{BH}})(\partial^\mu \phi_{\text{BH}}) - V(\phi_{\text{BH}}) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac},[\text{SCm}]} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\text{BH}}) = \frac{1}{2}m^2\phi_{\text{BH}}^2 + \frac{\lambda}{4!}\phi_{\text{BH}}^4 + \kappa \cdot \rho_{\text{vac},[\text{SCm}]} \cdot \phi_{\text{BH}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\frac{\delta S}{\delta \phi_{\text{BH}}} = R_{\mu\nu} - \frac{1}{2}g_{\mu\nu}R + \rho_{\text{vac},[\text{SCm}]}g_{\mu\nu} + F_{U_Bi_i}/r^2 = 0$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \xrightarrow{\text{DPM} + \text{ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{4 \text{ forces}} F_{U_Bi_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi_{\text{BH}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac},[\text{SCm}]} / \rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp! \left(- \exp! \left(- \frac{r - r_0}{\lambda_{\text{VDS}}} \right) \right)$$

For this system, the local VDS sub-ratio is 0.191 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 113, \quad n_{\text{channel}} = 22/26$$

Since $p_{\text{DVP}} = 113$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **106 M_BH/M_sun yr** (quasi-normal mode ring-down):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot (1 - e^{-[SSq] \cdot m/M_{\odot}}) \cdot \cos! \left(\frac{2\pi j}{26} \right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh! \left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}} \right) \right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c / r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.
