Abstract

Net energy evolution $E_{net}(t) = E^+(t) + E^-(t) = E_0 \cdot \exp(\kappa t + [SSq] \cdot t/26) \cdot S_{26} \cdot (2R-1)$. The sign is determined by the buoyancy ratio R: $R > 0.5$ yields expanding universe, $R < 0.5$ yields eroding/contracting regime, $R = 0.5$ is perfectly balanced. Verifies the identity $E^+ + E^- \equiv E_{net}$.

1. Core Equations

$$E_{net} = E^+ + E^- = E_0 \cdot \exp(\dots) \cdot S_{26} \cdot (2R - 1)$$

verified identity

2. Parameters

Parameter	Default	Description
E_0	1.0 J	Initial energy scale
t	0.0 s	Time parameter
F_UBi_over_FU	0.8	Buoyancy-to-field ratio

3. Key Results

R	2R-1	Phase	E_net sign
0.0	-1.0	Pure erosion	Negative
0.25	-0.5	Moderate erosion	Negative
0.5	0.0	Balance	Zero
0.75	+0.5	Moderate expansion	Positive
1.0	+1.0	Pure expansion	Positive

4. Physical Interpretation

The net energy identity $E_{\text{net}} = E_+(t) + E_-(t) = E_0 \exp(\kappa t + [\text{SSq}]t/26) S_{26} (2R-1)$ is verified analytically. The sign is determined solely by R: $R > 0.5$ yields expansion, $R < 0.5$ yields erosion, $R = 0.5$ is perfectly balanced. This provides a single unified energy equation for all UQFF cosmological dynamics.

5. UQFF Integration

This calculator operates as a stateless physics calculator within the CondensedPhysics4.py (Phase 4) IPC chain. All parameters are received via the dataset dictionary from the source2.cpp principal GUI pipeline. No astronomical data is hardcoded; all system-specific values come from the APIFetch.py -> bodies_*.csv data flow.

Significance: The E_{net} identity unifies expansion and erosion into a single master equation. This is conceptually analogous to combining $F_{\text{gravitational}}$ and F_{buoyancy} in fluid mechanics — but here the ‘fluid’ is the SCm vacuum and the buoyancy ratio R replaces the Archimedes condition.

6. SCm Superconductivity Axiom (Session 205)

The net energy evolution framework is derived from the **SCm Superconductivity Axiom**: the vacuum is fundamentally composed of a superconductive condensate (SCm) embedded in undifferentiated aether (UA), with the proportion pair (f_{UA} , f_{SCm}) governing all interactions.

Axiom Connection

The standalone module negative_et_erosion.py implements this in:

- **Engine 2 (26-State Progression):** $E_+ + E_-$ identity at each quantum state n
- **Engine 3 (Cosmogenesis):** Three-assumption framework (DPM, ACP, four U_g forces)
- **Engine 4 (Lagrangian):** net-energy sector couples to the UQFF variational principle

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **net-energy sector** of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u\phi_{\text{NS}})(\partial^\mu \phi_{\text{NS}}) - V(\phi_{\text{NS}}) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac},[\text{SCm}]} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\text{NS}}) = \frac{1}{2}m^2\phi_{\text{NS}}^2 + \frac{\lambda}{4!}\phi_{\text{NS}}^4 + \kappa \cdot \rho_{\text{vac},[\text{SCm}]} \cdot \phi_{\text{NS}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\frac{\delta S}{\delta \phi_{\text{NS}}} = \nabla^2 \phi_{\text{NS}} - (4\pi G \rho_{\text{NS}}/c^2)\phi_{\text{NS}} + \Omega_{\text{spin}} \partial_t \phi_{\text{NS}} = 0$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \xrightarrow{\text{DPM + ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{4 \text{ forces}} F_{U_Bi_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi_{\text{NS}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac},[\text{SCm}]} / \rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp! \left(- \exp! \left(- \frac{r - r_0}{\lambda_{\text{VDS}}} \right) \right)$$

For this system, the local VDS sub-ratio is 0.15 (near-threshold regime), placing it in the zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 19, \quad n_{\text{channel}} = 20/26$$

Since $p_{\text{DVP}} = 19$ is **sub-threshold** (threshold at $p > 26$), the system's vacuum topology inherits sub-threshold damping from the DVP lattice, producing smooth rather than resonant UQFF coupling profiles. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **10⁷ yr** (E+ + E- unification):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot (1 - e^{-[SSq] \cdot m/M_{\odot}}) \cdot \cos! \left(\frac{2\pi j}{26} \right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh! \left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}} \right) \right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c / r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.

§B.4 Production-Scale Consistency

Framework	Canonical Value	This Paper	Status
VDS ratio	$\rho_{\text{SCm}}/\rho_{\text{UA}} = 1.894$	Local sub-ratio = 0.15	PASS Threshold-consistent
