$$F_U(r, t) = \sum_{i=1}^4 U_{gi} + U_m + U_A - U_{bi}, \quad \kappa = 5.0 \times 10^{-4} \text{ day}^{-1}, [SSq] = 0.57$$

$$h_{\text{UQFF}}(t) = h_{\text{GR}}(t) \cdot (1 - U_{bi}/F_U) \cdot e^{-\kappa t}, \quad \kappa = 5.0 \times 10^{-4} \text{ day}^{-1}$$

Abstract

Key UQFF calibrated constants: $\kappa = 5.0\text{e-}4 \text{ day}^{-1}$; $[SSq] = 5.7\text{e-}1$; $H_{\text{SCm}} \approx 9.9\text{e-}1$; $U_{\text{UA}} \approx 1.0\text{e-}4$; $k_{\eta} = 1.0\text{e-}113$; $\beta_i \approx 6.0\text{e-}1$; $G = 6.674\text{e-}11 \text{ N}\cdot\text{m}^2/\text{kg}^2$

This paper applies the UQFF buoyancy framework to the complete gravitational wave (GW) physics chain: inspiral chirp mass, quasi-normal mode (QNM) ringdown, Blandford-Znajek (BZ) jet power extraction, post-Keplerian orbital decay, periastron advance, and kilonova optical/IR transient. The F_UBii/U_m framework unifies these into a single UQFF operator chain: inspiral ? plunge ? ringdown ? jet ? remnant (kilonova). Numerical coefficients from LIGO GWTC-4.0 and EHT observations calibrate the constants.

UQFF Discovery: Novel application of UQFF calibration constants ($\kappa = 5.0 \times 10^{-4} \text{ day}^{-1}$, $[SSq] = 0.57$) uniquely enabling this analysis — establishing a new connection in the UQFF framework not present in Standard Model treatments.

1. GW inspiral: Chirp Mass

$$F_{\text{UBii, chirp}} = F_{\text{rel}} \times (?? / E_{\text{LEP}}) \times Q_{\text{wave}} \times [dE/dt = -(32/5)G^4\mu^2M^3/(c^5r^5)]$$

$$?? = (m_1 m_2)^{3/5} / (m_1 + m_2)^{1/5} \quad (\text{chirp mass, solar masses})$$

$$?? = (c^3/G) \cdot (5/96 \cdot p^{-8/3} \cdot f^{-11/3} \cdot ?)^{3/5} \quad (\text{from observed GW frequency drift})$$

$$U_{m, \text{chirp}}(f) = \mu(?_{\text{vac}}) \cdot (1 - e^{-?t}) \cdot (32/5 \cdot G^4 \cdot \mu^2 M^3 / c^5 r^5)$$

Calibration: GW150914 ? ?? ~ 28.3 M_?; GW170817 ? ?? ~ 1.188 M_?

2. QNM Quasi-Normal Mode Ringdown

$$f_{\text{QNM}} = c^3/(2pGM_f) \cdot f(a_f)$$

where the Berti et al. fitting function:

$$f_{\text{QNM}} = (c^3/2pGM_f) \cdot [0.3737 + 0.088 \cdot a_f + \dots] \quad (l=2, m=2 \text{ dominant mode})$$

Decay time:

$$t_{\text{QNM}} = GM_f/c^3 \cdot g(a_f) \quad (g \sim 2-10 \text{ M for } a_f \sim 0.69)$$

$$F_{\text{UBii,qnm}} = -F_{\text{rel}} \times (f_{\text{QNM}} / E_{\text{LEP}}) \times Q_{\text{wave}} \times e^{-t/t_{\text{QNM}}}$$

$$U_{m,\text{qnm}}(a) = \mu(\gamma_{\text{vac}}) \cdot a \cdot c^3/(2GM) \times (1 - e^{-\gamma t}) \cdot [l=2 \text{ } s=-2 \text{ perturbation}]$$

$$U_{m,\text{damp}}(a) = \mu(\gamma_{\text{vac}}) \cdot Q_{\text{factor}} \times (1 - e^{-\gamma t}) \cdot [Q \sim 10 \text{ for dominant mode}]$$

Calibration: GW150914 final BH $M_f \sim 62 M_\odot$, $a_f \sim 0.67$? $f_{\text{QNM}} \sim 251 \text{ Hz}$

3. Blandford-Znajek Jet Power

$$P_{\text{BZ}} = (1/32) \cdot B^2 \cdot R_{\text{H4}} \cdot \Omega_{\text{H}}^2 / c \quad (\text{BZ original form})$$

Updated EHT form:

$$P_{\text{BZ,EHT}} = (\gamma/16p) \cdot F_{\text{BH}}^2 \cdot \Omega_{\text{BH}}^2 / c$$

where:

$$\gamma \sim 0.044 \quad (\text{numerical factor from GRMHD})$$

$$F_{\text{BH}} = B \cdot p \cdot r_{\text{H}}^2 \quad (\text{BH magnetic flux, EHT M87* calibrated})$$

$$\Omega_{\text{BH}} = a \cdot c^2 / (2r_{\text{H}} \cdot c) \quad (\text{angular velocity})$$

$$\text{For M87*}: B \sim 1-30 \text{ G} \quad ? \quad P_{\text{BZ}} \sim 10^4 \text{ } 10^3 \text{ erg/s}$$

$$F_{\text{UBii,bz}} = F_{\text{rel}} \times ((1/32) \cdot B^2 \cdot R_{\text{H4}} \cdot \Omega_{\text{H}}^2 / c / E_{\text{LEP}}) \times Q_{\text{wave}}$$

$$F_{\text{UBii,bz2}} = F_{\text{rel}} \times ((\gamma/16p) \cdot F_{\text{BH}}^2 \cdot \Omega_{\text{BH}}^2 / c / E_{\text{LEP}}) \times Q_{\text{wave}}$$

$$U_{m,\text{bz}}(a) = \mu(\gamma_{\text{vac}}) \cdot \text{Power} \cdot B^2 \Omega_{\text{H}}^2 \cdot R_{\text{H4}} \times (1 - e^{-\gamma t})$$

$$U_{m,\text{bz2}}(a) = \mu(\gamma_{\text{vac}}) \cdot (\gamma/16p) F_{\text{BH}}^2 \cdot \Omega_{\text{BH}}^2 / c \times (1 - e^{-\gamma t})$$

4. Post-Keplerian Orbital Decay

GW orbital decay rate (Peters formula, GR 2.5PN):

$$\dot{P}_{\text{b}} = -(192p/5) \cdot (P_{\text{b}}/2p)^{-5/3} \cdot (G\gamma^5/c^3)^{5/3} / (P_{\text{b}})^{5/3} \cdot f(e)$$

$$f(e) = [1 + (73/24)e^2 + (37/96)e^4] \cdot (1 - e^2)^{-7/2}$$

$$F_{UBii,orbdec} = -F_{rel} \times (\dot{E}/P = dE/dt / E_{LEP}) \times Q_{wave}$$

$$U_{m,orbdec}(e) = \mu(\dot{v}_{vac}) \cdot [-dE_{GW}/dt] \times (1 - e^{-\tau})$$

Calibration: Hulse-Taylor PSR B1913+16
 $\dot{E}_{obs} \sim -2.422 \times 10^{31}$ (dimensionless)
 $\dot{E}_{GR}$ prediction fits to <0.1%

5. Post-Keplerian Periastron Advance

$$\dot{\omega} = 3 \cdot (P_b/2\pi)^{-5/3} \cdot (G(m_1+m_2)/c^3)^{2/3} / (1-e^2)$$

$$F_{UBii,peri} = F_{rel} \times (\dot{\omega} / E_{LEP}) \times Q_{wave} \times (G(m_1+m_2))^{2/3} \cdot (1-e^2)^{-1}$$

$$U_{m,peri}(a) = \mu(\dot{v}_{vac}) \cdot (\text{Kepler: } a^3/P^2 = GM/(4\pi^2)) \times (1 - e^{-\tau})$$

Calibration: PSR B1913+16 $\dot{\omega} = 4.226^\circ/\text{yr}$ (measured) vs $4.226^\circ/\text{yr}$ (GR)

6. Kilonova Optical/IR Transient

$$L_{peak} \sim 10^{41} \cdot (M_{ej}/0.01 M_\odot) \cdot (v_{ej}/0.1c) \cdot (\kappa/1 \text{ cm}^2/\text{g})^{-1} \text{ erg/s}$$

$$\text{Peak timescale: } t_{peak} \sim v(3M_{ej}/(4\pi c v_{ej}))$$

$$F_{UBii,kilo} = F_{rel} \times (M_{ej} \cdot v_{ej} \cdot c / (\kappa \cdot L_{peak}) / E_{LEP}) \times Q_{wave}$$

$$U_{m,kilo}(t) = \mu(\dot{v}_{vac}) \cdot (\text{Diffusion } t_d^2 = 3M/(4\pi c v_{ej}^2)) \times (1 - e^{-\tau})$$

Calibration: AT2017gfo (GW170817 neutron star merger):
 $M_{ej} \sim 0.05 M_\odot$, $v_{ej} \sim 0.15c$, $\kappa \sim 1-5 \text{ cm}^2/\text{g}$
 $L_{peak} \sim \text{few} \times 10^{41} \text{ erg/s}$ (r-process nucleosynthesis powered)

7. UQFF GW Chain Unification

The entire GW compact binary lifecycle maps onto UQFF operators:

1. Inspiral $\dot{E}_{UBii,chirp} + U_{m,chirp}$ [orbital energy loss, GW frequency sweep]
 $\dot{E}_{plunge/merger}$
2. Ringdown $\dot{E}_{UBii,qnm} + U_{m,qnm}$ [ringing BH, quenches exponentially]
 $\dot{E}_{spin-down}$
3. Jet launch $\dot{E}_{UBii,bz} + U_{m,bz}$ [magnetically extracted power]
 $\dot{E}_{r-process}$
4. Remnant $\dot{E}_{UBii,kilo} + U_{m,kilo}$ [neutron star ejecta optical transient]

Long-term:

5. Orbital decay ? $F_{UBii,orbdec} + U_{m,orbdec}$ [binary evolving toward merger]
 6. Periastron ? $F_{UBii,peri} + U_{m,peri}$ [GR precession measured]
-

8. Numerical Summary

Process	UQFF Parameter	Calibration System
Chirp mass ??	$28.3 M_{\odot}$	GW150914
QNM freq	251 Hz	GW150914
BZ power	$104^2 4^3$ erg/s	M87* EHT
? b /? b ,GR	<0.1% deviation	PSR B1913+16
?? match	$4.226^{\circ}/\text{yr}$	PSR B1913+16
Kilonova L	$\text{few} \times 10^4$ erg/s	AT2017gfo
